American Plows in Russia.—The year 1903 was a very satisfactory one for the sale of agricultural machines and implements in Russia. The American articles in this line continue to hold the field, and their number is increasing. Harvesters, binders, reapers, mowers, rakes, corn shellers, etc., have always been in favor in the country and their sale has been large. The American plow has now secured a permanent foothold in Russia, and its future promises to be a very satisfactory one.—*Farm Machinery*.

Increases Railroad Safety.—American railroad development has reached the point where a man can sit comfortably in a private car and see recorded on paper before him every imperfection of the rails over which he is riding. Twenty years ago, a track-walker with a hammer tramped the cross-ties to find out this same thing. The track-walker's work and much more is now done by the dynograph, a mechanism which not only records the deviations the rails make from a straight and level line but automatically computes these deviations in feet and inches.

Minister Oi Worked in American Factory.

AS a common, ordinary factory hand a high Japanese official gained knowledge and experience in the United States which has evidently been of incalculable value to him in his subsequent career.

"Away back in the early '80s," said a well-known electrician of the city of Pittsburg, U. S. A., recently, "there came to me with a letter of introduction from the president of the company a young Jap, and the note directed that he be given every opportunity to work in all the departments of the factory, so that he might be proficient in every branch. He was apt, willing, always wore a grin and remained at the place about two years."

The teller of the story found out during these two years that the boy had been working as a lineman before he appeared at the factory. His name was Oi. He went back to Japan, and only at Christmas time, by a present, was the electrical engineer reminded of him. Many years later the engineer was waited upon by three Japanese who wanted to know all about the very latest devices for telephones and telegraphs. They were electrical engineers and had been taught all they knew at the Imperial University in Tokio by a Prof. Oi, from whom they carried a letter of introduction to the engineer. They were Imperial Commissioners, and the engineer took them all over the country explaining things. The brightest of the three was called Wadachi and the others were Nakayama and Okonoto. They told their mentor that Oi was now Minister of Posts and Telegraphs in Japan, and this important position he now holds during war time.

One Secret of American Manufacturing Success.

IN Europe the idea is generally prevalent that, despite America's industrial success, the craftsman is disappearing in the United States. This may be true in those industries where he should disappear because of his former work being better accomplished in other ways; but in those industries where he should continue America stands at the head of all nations, for she possesses the best talent from all. In American manufacturing there is unquestionably carelessness in the use of raw materials, because they are generally cheap, while the highest possible efficiency is obtained from labor, because it is dear. In Europe the reverse is the case. Great economy is manifested in the utilization of raw materials, because they are ordinarily dear, and very low efficiency is secured from labor, because it is cheap. High efficiency of labor, with its corresponding high rates of wages, naturally increases the home consumption of manufactured products, while the most thorough utilization of power and attendant use of machinery, incident to high rates of labor, does on many articles reduce manufacturing costs to a lower figure than where time rates of labor are less.—*The Engineering Magazine for May*.

How the Scientist Benefits the Wage Worker.

NO one does as much as the scientist to provide work for skilled and unskilled workers. Every invention means that more people must be employed. Prof. Ira Remsen, the scientist, called attention to this lately in a speech delivered in St. Louis. He said: "Many thousands of workmen are now employed, and many millions of dollars are invested, in the manufacture of dye-stuffs that were unknown a few years ago. Thousands of scientifically trained men are engaged in the effort to discover new dyes to meet the increasing demands. New industries are springing up and many find employment in them."

"As a rule the increased demand for labor caused by the establishment of these industries is not offset by the closing of other industries. Certainly it is true that scientific investigation has created large demands for labor that could hardly find employment without these demands."

Our Trade with Sierra Leone.—The direct imports from the United States into Sierra Leone for 1902 were valued at \$229,787, as against \$195,374 the previous year. There was much activity in the building trades, which was followed by increased importations of material from the United States. The arrangement by which articles of merchandise can be purchased in the United States and sent by parcel post to the British dominions, including Sierra Leone, was gladly welcomed by the people generally of this colony. They are taking advantage of this opportunity, which I am quite sure will very greatly benefit the export trade of the United States here and elsewhere in British West Africa.—*John T. Williams, United States Consul, Sierra Leone, Africa*.

Spain Likes Our Farm Machinery.—American agricultural machinery and implements are well accredited in Spain on account of their superior quality and good working conditions. About 35 per cent. of the agricultural machinery sold in Spain is of American make, two-thirds of which are plows. Considerable quantities of American machinery are imported as of English or German make on account of the discriminating tariff, which is about 20 per cent. higher for American than for European imports.

Clever American Cattle.—American cattle raisers have noticed in recent years a wonderful illustration of animal intelligence and instinct. The cattle of former days were of the long-horned kind, and when a herd was threatened with an attack by wolves, the calves were placed in the middle of the bunch and the older ones formed themselves into a circle, all facing outward. Now that the cattle are mostly hornless, they place the calves in the middle, as in old times, but face inward themselves, thus presenting their hoofs to the wolves.

ESTABLISHED 1846.

ESTEY ORGAN COMPANY,

Brattleboro, Vermont, U. S. A.

Cable Address: "Estey," Brattleboro, U. S. A.

Builders of High-Grade Organs and Pianos

Over three hundred and fifty thousand (350,000) in use throughout the civilized world.

The **Estey Reed and Pipe Organs** are specifically made for use in churches, chapels, music and lecture halls, Masonic lodges, schools and residences.The **Estey Pianos** are made in several styles of Upright and Grand.

Our Catalogue, illustrating and describing the various styles of Organs and Pianos made by us, mailed postpaid to all parts of the world.

None but the most skilled workmen and the best of material are employed in the making of the **Estey Organs and Pianos**. Prices quoted F. O. B. cars at New York City. Specify "Estey," and when ordering, to avoid errors, please mail us a duplicate of order.**NOTE.**—To facilitate the handling of our export trade we desire to communicate with one responsible musical instrument dealer in each trade center of the world.**ESTEY PIANO. Style 20.**

Made in mahogany, oak and American walnut. 7½ octaves, scale A to C. Height, 4 feet 3 inches; Length, 5 feet; Depth, 2 feet 3 inches; Weight, boxed, 850 pounds.

**ESTEY ORGAN. Style "S."**

Solid walnut or oak case. Height, 6 feet 8 inches; Breadth, 3 feet 10 inches; Depth, 1 foot 11 inches; Weight, boxed, 400 pounds.

We guarantee this Copper Paint to be the easiest to apply and, owing to its being so finely ground, it is the smoothest paint in the market.

Highest Medals from National Export Exposition and American Institute, New York City.

New Jersey Yacht Red Copper

For Yachts. Brightest Color Made.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with **New Jersey Copper Paint**, manufactured by Harry Louderbough, proprietor of **NEW JERSEY PAINT WORKS**, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where **New Jersey Copper Paint** was applied—it is splendid condition.

A PAINT THAT PROTECTS,

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.
MILLS EDWARD, Master Schooner "Florence Shay."

AGENTS WANTED EVERYWHERE FOR

THE BEST LIGHT**The Cheapest and Strongest
Light on Earth.**

Makes and burns its own gas. It is portable; hang or set it anywhere. Requires no pipes, wires or gas machine.

Wood-Working Machinery Progress in America.

OHIO is an American State that gives evidence of the general progress of the country, and *Harper's Weekly* furnishes a chapter regarding its development that is worth reproducing for that reason. The State of Ohio, situated in the center of an extensive timber-producing area, has many large and important furniture factories, show-case and fixture works, sash, door and blind factories, saw and planing mills, as well as carriage, wagon and farm-implement works, veneer and hardwood lumber mills, and the State supplies a large proportion of the intricate machinery used in the working of wood.

Enormous factories occupying acres of floor space, which confine their efforts solely to the manufacture of the highest types of labor-saving devices for working and finishing wood in all its many processes, from the rough-hewn timber to the most beautifully carved and finished cabinet-work, have their home in the Ohio city of Cincinnati, which, with its railroads radiating in every direction and its splendid river facilities, stands to-day preeminent in this important branch of the machinery world.

About the year 1830, before the advent of the railroads across the Alleghenies, certain American manufacturers, realizing the growing demand for wood-working machinery in this part of the country, and knowing the difficulty of transportation across the mountains, located their plants in Cincinnati, O. This industry has been so thoroughly systematized and so ably handled that to-day there is more wood-working machinery made in that city than in any other place in the world. The output of the various factories of Cincinnati is fully \$10,000,000 per annum.

The growth of this industry has naturally gathered together the most skilled designers of machinery, expert mechanical engineers and the highest types of mechanics. Machinery builders from foreign countries when visiting America rarely fail to visit the works there located, which are recognized as the most advanced in their line.

The extent of the business enables the factories to specialize in their work. Distinctive departments are devoted to the manufacture of planers alone; other departments make exclusive band saws, while others again make only circular saws.

There is hardly an operation in the manipulation of wood formerly done entirely by hand tools that has not its special machine, and many of these labor-saving devices were originated in Cincinnati. For instance, the friezing or shaping machine which is now used in every country of the world originated and was first made and used in a factory in Cincinnati, so also with the "jig" or unstrained scroll saw. Many improvements on other machines were also first made there.

Heavy machines for the working of large-sized railroad and bridge timbers for arsenals and navy yards are supplied from there to almost every government of the civilized world, and band-saw mills, for the reduction of logs into standard-length lumber, flooring-machines for the manufacture of ceiling, flooring, casing and drop siding, as well as the all-important machines for molding, shaping, sandpapering, mortising, tenoning, graining, dovetailing, matching, mitering, led the world in the excellence and advancement of their design and mechanism.

An important branch of the wood-working machinery business is that of carriage and wagon machinery. Automatic spoke lathes which make a complete wagon spoke by simply placing an original model of same in the machine, and hub and rim machinery, bending machines, etc., are most interesting and ingenious inventions. The integrity and skill shown in this line of work are a part of the progressive idea which places Ohio more and more every year in the front rank of manufacture and industrial art.

Sending Letters and Packages by Wire.

PROFESSOR MORSE, of New York, discovered that messages might be sent by electricity over a wire; Marconi has found a way to send messages through the air without any wires. Count Robert Taeggi has just worked out a system of despatching letters and parcels by wire. Is it possible that some inventor of the next generation will show us how to shoot letters and parcels through the air from city to city without any wires? The current number of *Popular Mechanics*, perhaps the most progressive and interesting monthly publication of mechanical and inventive progress in America, explains for the first time this most interesting system of rapid-transit letters and parcels by electricity. *Popular Mechanics* says:

"The 'electric post,' which may be the means of transmitting letters and parcels along electric wires at a speed of 250 miles an hour, is being-promoted in England. American capitalists have their eyes on the venture, and it may not be long before we are sending and receiving letters and packages by electricity between the principal cities of the United States. Many in England believe the 'electric post' will prove the most important mechanical development since the first railway was built; that it will soon do away with railway mail trains, letter-carriers, sorting clerks, etc. The system is worked throughout by electricity. By its means a letter could be posted in Chicago and a reply received from New York, 900 miles away, in the same day. A St. Louis draper could place an order for light goods with a Chicago dealer and have the goods delivered before night, for the 'electric post' can carry parcels as well as letters.

"To better explain the working of the system, let it be supposed that the dome of the new Chicago post-office is the central station of the 'electric post' for service in the city of Chicago. From the top of the tower wires would

converge in all directions, reaching throughout the city, supported at intervals by columns 50 feet high, called collecting poles. There would be a pole about every block along the principal business streets of the city. At the base of each of the poles there would be a box in which to post the letters.

"An automatic arrangement inside the box would deface the stamps on the letters, at the same time inscribing the latter with the number of the collecting pole and the date and hour of posting. Every five minutes there would be sent from the central station an empty box, with motor attached, which would run on wheels along the wires. The wires would not only fill the same purpose as rails, but would act as conductors of the electric current to drive the motor.

"On reaching the first collecting pole the box would stop and open itself. At the same time it would cause the collecting box at the base of the column to run up the center of the latter and empty its contents in the receptacle provided. The motor box would then resume its journey, calling at each city pole in turn. Having performed its circuit, the motor box with the letters would return to the central station. There the letters would be sorted and those for other cities would be placed in similar wheeled boxes and despatched along the wires to their destination."

"Practically speaking, the 'electric post' is an electrical aerial railway, with letter-boxes in place of carriages. Cities of the size of St. Louis, Boston, Philadelphia, Washington, Buffalo, Cleveland, Kansas City, San Francisco and New Orleans would be in direct communication with New York and Chicago. Smaller towns would be served from the nearest important center, to which letters would be transmitted in the first place. A great network of wires would be spread over the United States.

"To avoid the possibility of boxes colliding on their way, two sets of wires would be provided, one for the outward and the other for the inward journey. Boxes traveling in the same direction would be kept three miles apart by a 'block' system. 'The vehicles follow one another uninterruptedly,' says Count Taeggi, 'and obey, as it were, the word of command given them at the start.'

"The inventor has provided against the possibility of the mails being robbed while on their midair journey. Every supporting pole would be filled with a fulminating ring, which he calls 'the ring of death.' Being connected with one of the high-potential wires, this ring would inflict a fatal shock upon any stranger climbing to the top of the pole."

German Editor on American Relations.

HERR HUGO VON KUPFFER, editor of the Berlin *Lokal Anzeiger*, one of the largest and most influential newspapers in the German Empire, arrived in America last month on a mission of observation and investigation. Herr von Kupffer expects to remain about two months in this country, visiting different large cities and inquiring into the work of State and municipal institutions.

"In Germany we have come to look upon America as the land of unlimited possibilities," said Herr von Kupffer. "While it is true that one purpose of mine is to visit the Exposition at St. Louis and describe it, another object I have in coming is to study certain American institutions. I think the United States has gone very far forward in matters which pertain to the public welfare. Your provisions for orphans, for the blind, your hospitals, your immigrant institutions are extremely interesting. That side of America appeals to me more strongly than the commercial or industrial side. I have seen America in a time of great depression as well as in a period of great prosperity. I suppose it is imperial America that I now see."

Discussing the relations of Germany with America, England and France, Herr von Kupffer said:

"Between Germany and America there is a feeling of honest commercial rivalry, but nothing like national or individual dislike. It must be borne in mind that there is sometimes a great difference between government feeling and popular feeling in Germany. There is no doubt in my mind that my Government has not the slightest degree of ill-feeling toward America. Germany and France are now on good terms also.

"Do you know it is extraordinary the kind of literature which used to be printed in Germany about America. German writers who came over here saw only peculiar or eccentric customs and institutions and wrote only about that sort. Of course, if people had only such things to read about America, they formed their opinions on that basis, consequently America was looked upon as a nation of eccentricities. This is changing, and there is now so much travel back and forth that a better knowledge of the country has been obtained.

"A large number of Germans are coming over here this summer. I was talking the other day with a manager of a travel bureau, which has arranged a series of excursions to the United States, and he told me that he was fully booked for months ahead. And it is not primarily to see the Exposition. There is, after all, no wide interest in that in Germany, either from a commercial or other standpoint. But it serves as a pretext, and curiosity to see this great country for themselves is the motive which impels our people to come over."

Herr von Kupffer was very much interested in the appearance of New York which he said had changed greatly since his last visit.

"Are skyscrapers really necessary?" he asked. "Why is it that there are so many in New York?"

It was explained to him that real estate, like time, was money in the districts where they have been erected, and he felt satisfied, apparently, with the explanation.

THERE MAY BE VAST VALUE UNDER YOUR LAND.

The most valuable minerals are deep in the bowels of the earth.

THE PORTABLE STAR... DRILLING MACHINE

Is the most strongly built,
the simplest and the most
economically operated
machine in the market...

Any man of average intelligence can run this machine.
No experience is required.

H. A. Richard & Bros., of Marlboro, Ohio,
say: "It is a fast driller and the best pipe
driver in the market. It is giving us per-
fect satisfaction."

Duff Bros., of Darlington, Pa., write: "We
have been able to drill at a price so low that
no other machine could compete with the
STAR. Expense for repairs comparatively
nothing."

**Star Drilling Machines are made in ten sizes.
Will drill 250 to 2500 feet.**

We also manufacture Drilling and Fishing Tools.

Send for illustrated catalogue.

**STAR DRILLING MACHINE CO.
Akron, Ohio, U. S. A.**

Cable Address:
"STARDRILL."

Uses "A-B-C Code, 4th Edition."
or "Universal Code of Lieber."

The Perfect Coffee Classifier.

MONITOR COFFEE SEPARATOR AND GRADER.

This machine removes all foul material and fragments, makes
clean separations and grades perfectly in five sizes: Large, medium
and small flats, large and small peaberry.

Made in five sizes, and capacities from 6 to 30 bags per hour.

Monitor Rice Separators are used more extensively in the rice
industry than any other make of machine.

Monitor Grain, Cereal and Seed Cleaners are unequalled for
quantity and superiority of work and low operating expense.

Send to-day for our Illustrated Catalogue of the entire Monitor
line, with export prices F. O. B. steamship, New York City.

HUNTLEY MFG. CO., Silver Creek, N. Y., U. S. A.

"The Standard"

"The Standard," Style "B," Without Switch.

Our Fans are used in all parts of the world. Our experience with foreign
requirements enables us to meet all conditions, especially in respect to special
insulation. Other strong points are artistic design, high finish, economy in
operation and blade-carrying power.

Recommendations of our customers are our best guarantees.

**CEILING, DESK and BRACKET types, for
all direct-current circuits.**

Write for further particulars, descriptive literature, prices, etc.

Our Standard Motor Book (20 pages), illustrating and describing fully our
complete line of Standard D.-C. Motors and Dynamos up to 15 H.-P., cheerfully
mailed for the asking.

**THE ROBBINS & MYERS CO.,
SPRINGFIELD, OHIO, U. S. A.**

Friedman Bros Shoe Co.

ST. LOUIS, U. S. A

MANUFACTURERS OF

Shoes for Export

TO ALL PARTS OF THE WORLD.

Established 1854.

Before a critical public a
half century, the "Fried-
man Shoe" now, as ever,
stands supreme.

OUR FACILITIES:

Two mammoth electrically
equipped factories with a capacity
of 10,000 pairs daily; over 100,000
square feet of sales and store
rooms; a well-organized foreign
department for our export trade
exclusively; unexcelled ware-
house and shipping capacity.

We solicit trial orders from responsible houses, assuring lowest
prices and prompt shipment.

Further information, as well as Illustrated English or Spanish
Catalogue, sent on request.

Electric Marvels of United States Printing-Office.

ELECTRICITY'S marvelous adaptation to industrial uses can be shown to no better advantage than in the United States Government Printing-Office, in Washington, D. C. A writer in the *New York Times* has contributed to current literature an interesting article about this great plant, where under a single roof are more than 600 electric motors alone, driving various kinds of machinery. It is doubtful if any other establishment in the whole world equals this in mere numbers, let alone in the vast variety of purposes for which the motors are employed. Electricity reigns. It lights, it heats, it drives and it transports. It is the wax melter, the gluemaker and tool-heater, as well as the driver of the elevators, the printing-presses and the fire-pumps. Even the big engines which drive the dynamos are dependent upon an electric pump to oil their bearings, and electricity supplies the 4,000 employees with water for drinking and for the toilet, as well as carrying them to their work and lighting the workrooms.

In no other building in the world is electricity commercially employed for such a diversity of purposes. Nowhere else is there such a collection of electrical devices in regular use. From the time the workers arrive until they leave there is never a moment when the ponderous generators in the powerhouse are not helping them in some way. At their incoming electric elevators take them to the workrooms, and at night take them back again. Over the whole 350,000 square feet of floor room there is an electric light for about every 25 feet square, besides clusters and ornamental arrangements of lamps in many places. Electric lifts carry work and materials from floor to floor, and motors run big and little machines everywhere. Even knives for cutting wax have their blades warmed by the electric current.

Throughout the establishment electricity is the ready slave of every one. Whatever steam and gas and coal could do it does, and its ability to do all of these things with facility, economy and handiness is here fully demonstrated. When one considers the magnitude of the office, the bewildering maze of wires required to carry the electricity to every part, the multitude of machines and devices, it seems as if the whole were almost too complicated for any human being to comprehend. Yet when one watches great electrically driven presses controlled by a touch, elevators with heavy loads sent speeding to and fro by pushing a button, or heating devices regulated to the niceties of just keeping a pot of glue warm or of melting solder, the simplicity of it all becomes its most wonderful feature.

Over the six acres of actual working space are scattered more than 600 electric motors, besides the scores and scores of other electric appliances. The largest of the motors is of 100 horse-power. The smallest is of one-sixth horse-power. There are many of these small motors, each taking only a little more current than a couple of incandescent lamps require. The source of the power is a building where four generators are installed, capable of producing combinedly 2,170 horse-power under ordinary demands, or a quarter more if necessary.

At the very entrance the visitor is confronted by the big elevators. Eight are for passengers, five for freight. One of the latter can lift a load of 10,000 pounds at a rate of 150 feet per minute, another lifts 6,000 pounds 100 feet a minute, and the others take loads of 5,000 pounds each and whisk them upward at a rate of 350 feet a minute. Most interesting, however, are two "form" lifts, which play over a distance of 100 feet in height, running between the composing and press rooms and through the other departments. These are strong enough to carry the heaviest "forms" of type and have platforms 6½ by 4 feet to accommodate large chases.

Electricity not only runs these "lifts," but controls them. A workman has merely to push a button when he wants a lift. If it is disengaged it comes to him automatically, stopping and lighting a lamp when it gets to his floor. So long as he keeps the door open no one else can disturb the car, nor can they control it in any way after he has closed the door and pushed a button to send it to some particular floor until it has performed its mission, been unloaded and dismissed. Up and down all day go the lifts, carrying forms, from which the electrically driven presses turn out 60,000 to 70,000 pounds of printed matter every day.

To describe the workings of each of the electric machines and tools would require the telling in detail of the whole of the modern art of printing and binding. It would mean to follow the printed matter from the composing room to the stereotyper, from there to the pressroom, and then to the folders and binders, and incidentally to make many side excursions and at every point to watch electricity helping forward the processes. Even when all was told none but the experts could fully appreciate the perfection of the electric tools, their economy and the accuracy with which they can be regulated. Flexibility is one of electricity's great charms.

Does the workmen want high speed or low, great heat or moderate temperatures, either can be furnished with certainty, while with a finger touch speeds can be raised or reduced, temperatures increased or diminished, or the current cut off entirely. A visit to the Government Printing-Office will make evident to the least skilled observer the handiness of electricity, its cleanliness and healthfulness, and he cannot fail to observe how the absence of shafting and belting adds to the space, the comfort of the workers and to the free diffusion of light.

The yearly output of the Government Printing-Office costs \$6,500,000. It would represent much more than that in a commercial office. It covers 210,000 reams of ordinary paper, flat or in rolls, and something like 10,000

reams of fine, coated book paper for better work. Three million sheets of card and Bristol board and thousands of reams of other sorts of paper are used every year.

American Trade with Asiatic Turkey.

WARES of American make are becoming much better appreciated in Asiatic Turkey than ever before. A report to the United States Department of Commerce from Thomas H. Norton, Consul at Harput, contains some interesting facts and reasons for the favor with which American goods are regarded in that part of the universe. Mr. Norton's communication is too lengthy to print in full, but some extracts will interest our readers in Europe and other parts of the world as well.

"Four-fifths of the emigration from Asia Minor to the United States is from the Harput district, which is in the center of Asiatic Turkey. In consequence of this extensive movement of population, nearly every family has a relative or friend in the United States. As a natural result, gifts of American articles are frequent. Money is remitted in considerable amount. The annual remittance has at times reached \$500,000; it is now \$360,000.

"The widespread influence of the American educational effort at Harput during the last half century has done much to prepare the way for commercial effort. It has brought about a feeling of respect and admiration for the American home and its accessories, for our books, periodicals, inventive skill and practical devices and enterprise. It has likewise led to a deep-seated confidence in the integrity and business principles of the American nation.

"Another helpful feature is the growing dissatisfaction with the articles of European manufacture which have been brought to this market in quantities during the past decade, more particularly from Austria, Germany and Italy. Those wares of American make which are found in the homes of the resident American colony, or have been introduced here for sale, are of such durability that there is a desire for closer trade relations with the country of their origin."

Consul Norton goes into the subject in detail. He reports that American knitting-machines are in successful operation; that there are good reasons for believing that the trade in American shoes could be increased, and he further says: "Some American tools for working both wood and metal have found their way here and are thoroughly appreciated. Inquiries are frequent for small steam and petroleum engines, lathes, sawmills, flouring mills, cotton and wool machinery, water-power outfits and cotton gins."

In conclusion Consul Norton says: "There is but little doubt that the time is ripe, and that there is an exceptional opportunity just now for American commerce to gain so firm a foothold in this region that serious competition would become a matter of great difficulty for many years to come."

American Railway Gives Away Bouquets.

EVERY woman passenger who goes to Niles, Mich., U. S. A., on the Michigan Central Railroad receives a bouquet of cut flowers as a gift from the company. It matters not whether she stops at the station or is just passing through. A uniformed railway employee jumps on every train as it approaches the depot and distributes the dainty blossoms to each woman on board. No matter if it be midwinter, the programme is the same.

The road has a hothouse connected with this depot. In one bed are 4,000 geraniums, under which the soil is heated by imbedded steam-pipes. Near by are sweet peas, snowy oleanders, heliotrope, lilies—everything in the way of flowers. It was more than a decade ago that the company's officials imbibed, whence it is not recorded, the sentimental project of giving to every feminine patron a bunch of flowers. The hothouse at Niles is the outgrowth of that idea.

Electricity as a Handy House Servant.

IN the United States no up-to-date home is now complete without electricity, and the number of uses to which it can be put is increasing every month.

It makes a most valuable and handy house servant. For instance, you can have not only electric light, but an electric stove to warm the house and an electric fan to make it cool. There are electrically heated flat-irons, curling-irons, chafing-dishes, griddles, toasters, cereal boilers and coffee urns. The expense in using these is not more than three-quarters of a cent an hour. An electric "hot-wire" bag has lately come into use, to take the place of hot-water bags. Tiny motors, a foot high, are being used to run sewing-machines, so that even an invalid can operate a machine. Electrically heated dumb-waiters are to be used in a couple of hotels now being built in New York City, and there seems to be no limit to the usefulness of the mysterious power which will interest scientists and inventors for years to come.

American Imports Into Hungary.—The American exporter should know that Hungary's imports in 1903 increased, especially in machinery, scientific and musical instruments, paper and paper wares, chemicals, leather and leather goods, stone coal and iron and ironwares. That less was paid for sugar, clothing and underclothing than in 1902 is due to the rehabilitation of the trade in those lines.—*Frank Dyer Chester, United States Consul, Budapest, Hungary.*

ANIMAL TRAP CO., ABINGDON, ILLS., U. S. A.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here
have revolutionized the watch
trade of the world. They have
established new standards of
value. Buyers of watches, in
justice to their own interests,
must consider this line. Foreign
buyers have long been ac-
customed to purchasing cheap
watches, both cheap in name
and quality, but we now offer an oppor-
tunity to purchase watches guaranteed
to keep good time at very low prices.

Our watch factory is the largest in the
world devoted solely to manufacture of time-
pieces. The output is five thousand watches
per day, which go to all parts of the
world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.

Our Catalogue, illustrating and describing our various styles of Combination Library, Dining, Pool and Billiard Tables, mailed postpaid.

"LA FAYETTE"

Combination Billiard, Pool and (with Top) Dining or Library Table.

This table is of a graceful French design, and is beautiful in every detail. It is a copy of a popular French design of the Second Empire. It is veneered in beautiful Tabasco mahogany, fitted with genuine rubber cushions, French imported billiard cloth and has a Vermont slate bed. Equipment includes our PATENT POCKET COVERS, allowing this table to be used equally as good for BILLIARDS as for POOL. 6 finely turned maple cues (4 of which are fancy inlaid), 4 GENUINE IVORY BILLIARD BALLS, and a set of 16 POOL BALLS accompany each table. Size of playing surface, 32x64 inches. Price, complete, \$57.50. In U. S. Gold or its equivalent, delivered f. o. b. New York. Weight, boxed, 650 lbs. (294.8 kilos); 28 cubic feet (812 cubic decimeters).

OLDS GASOLINE ENGINE WORKS,
209 River Street, Lansing, Mich.

WOODWARE SUPERSEDED BY THE INTRODUCTION OF THE International Washing Machine.

(Galvanized Steel)

Washing Machine.

Will wash fabrics, coarse or fine, as quickly and cleanly as any washing machine made, and being made of Galvanized Steel will outlive and outwear ANY THREE Wooden Washing Machines.

The galvanizing is performed after the machine is put together, thus preventing cracks, which would cause rust. Being absolutely germ-proof, is the only perfect, sanitary washing machine in existence.

\$11.00 Upon receipt of Eleven Dollars, U. S. Gold (or its equivalent), we will crate, ready for steamer and deliver f.o.b. cars at New York City, \$11.00

TWO (2) INTERNATIONAL (Galvanized Steel) WASHING MACHINES.

Each machine occupies six cubic feet. Weighs seventy-two pounds.

DOYLESTOWN, OHIO, U. S. A.

Invincible Dustless Milling Separator.

This Separator is very superior to all other makes and marks a long step in advance of its competitors. We claim that it possesses many new and valuable features as a wheat-cleaning machine.

It is strong, compact, light-running, economical and efficient. It does not waste or injure the grain, and requires but little care or attention to keep it in order.

This Milling Separator removes, without waste, all those impurities from wheat which lessen the value of the finished product, and consequently no flour mill is complete without one.

Send for full particulars to the manufacturers,

weight 4 lbs.,	\$50
Battery, extra, weight 12 lbs.,	6

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

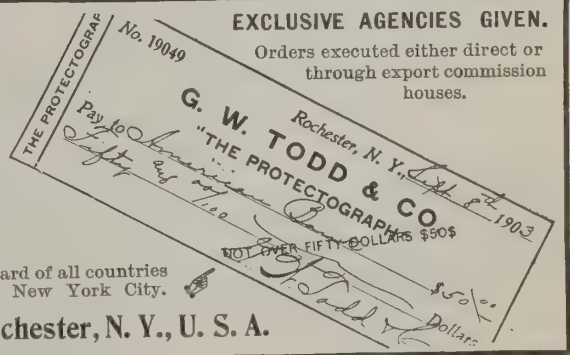

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is **\$30**, delivered New York City.

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has **Revolving Steel Ball Gearing**, reducing the friction and thus making the machine so **light running and almost noiseless**.
2. The tub is made of **Louisiana Red Cypress** lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside or the tub, as are all of the castings.
3. The wheel turns right or left, **pin-wheel or dasher reverses automatically**, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
5. The tub has a wringer box, fastened with steel brackets.
6. The lid on tub closes tight, no escape of steam.
7. Has glided hoops, castings and name.

Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

Manufactured Exclusively by

H. F. BRAMMER MFG. CO.,

DAVENPORT IOWA, U. S. A.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage.

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

Style 2.

THE GLOW NIGHT LAMP CO., Incorp., 73-75 PEARL ST., Boston, Mass, U.S.A.

A HATCHING WONDER

The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17 1/2 inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent and impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

PELTON WATER WHEELS

PIKES PEAK POWER CO.

The illustration herein shown is that of Pikes Peak Power Co.'s Hydro-Electric Transmission Plant, located near Victor, Colorado. It consists of three 1,000-horsepower Pelton Wheels, operating under 1,180-foot head and direct-connected to electric generator.

This electric power is supplied to the many mines, mills and other industries in that vicinity. This plant has been running day and night for four years at practically no expense for repairs. Send for catalog illustrating many other plants of similar character.

PAINTING BY MACHINERY.

THE SPRAY PAINTER.

FOR APPLYING ANY KIND OF PAINT OR WHITEWASH.

Over 30,000 of Our Painting Machines in Actual Use. More than all other styles combined.

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.
THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the Louisiana Purchase Exposition amount to something over 12,000,000 square feet, all of which is practically completed at this writing, and at least 95 per cent. of this work was done with the machines we bought from you. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

We take pleasure in stating that, in our estimation, your machine is far superior to anything on the market.

The cold-water paint used amounted to almost 400,000 pounds.

Respectfully yours, BUILDERS' CONTRACTING COMPANY.

SPECIAL OFFERS FOR EXPORT:

Hook's "Best" Pneumatic Painting Machine (twenty-five of which were used in painting the buildings of the Louisiana Purchase Exposition), equipped with 25 feet pneumatic hose, 8-foot extension rod, for reaching ceilings and overhead work, and two nozzles. Gross weight, 250 pounds. Net weight, 125 pounds. Size of box, 20½x19½x47 inches. **Price, each, \$25.00.**

Hook's "Best" Pneumatic Painting Machine.

Hardie's No. 7 Painting Machine comprises a patented brass pump with brass ball valves, ingenious agitator and paint mixer, contained in a 30-gallon barrel, mounted on wrought-iron wheels, 26 inches in diameter, with 1½-inch tires, and is as easy to wheel as a baby carriage. It is equipped with 10 feet of high-grade ½-inch hose, long extension rod and special disgoring painting nozzle. Will spray any liquid of a sprayable nature. Weight, 110 pounds. Packed in two cases—one 9 cubic feet, one 7 cubic feet. **Price, each, \$17.50.**

Hardie's No. 7 Painting Machine.

The prices above quoted (U. S. Gold) include packing and delivery at New York City.

THE "STAY-THERE" READY-MIXED COLD-WATER PAINT

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. It is as durable as oil paint; is fireproof, weatherproof, washable and sanitary.

SPECIAL OFFER FOR EXPORT.

Interior Paint (white), per ton of 2,000 pounds net, - - **\$30.00** Exterior Paint (white), per ton of 2,000 pounds net, - **\$50.00**

Packed in barrels weighing about 400 pounds, measuring 28 x 28 x 20½ inches. These prices are F. O. B. dock at New York City.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the **Only** machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

DIETZ
Nos. 30 and 60
TUBULAR
SEARCH
LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills, workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1 1/4-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2½ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

Orders received through any exporter in New York, Boston, Philadelphia or Baltimore, or through our own Export Office, 54 Warren Street, New York. E. L. D. Hester, Mgr.

Our Catalogue, illustrating and describing the various styles of Refrigerators made by us, mailed postpaid to all parts of the world.

Seven walls to save the ice. Airtight locks. Sliding, adjustable shelves, and many other improvements. Outside cases, ash with quarter-sawn oak panels, dark golden finish. Walls packed with mineral wool.

These prices F. O. B. New York, Boston, Philadelphia or Baltimore, crated for export. The sizes given are: first, width across the front; second, depth from front to back; third, height. All outside measurements in inches.

GRAND RAPIDS REFRIGERATOR CO., Grand Rapids, Michigan, U. S. A.

ONCE SOLD, THEY NEVER COME BACK.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

THERE IS NO FRICTION.
NO LOST MOTION.

AMERICAN SHIPBUILDING.

WE frequently receive communications from associations interested in the upbuilding of the American merchant marine. Our friends abroad are not much concerned in knowing how we do things, but are anxious to receive the goods which we manufacture and they want. We have not taken up the subject largely for that reason, except to point out that some of our American shipbuilders are doing wonderfully well. Our attention has been called to a statement by Edwin D. Metcalf, who has opposed subsidies for American ships, in which he says:

"If the shipbuilders spent more time at their work improving their methods, trying to find means to compete with British shipbuilders, and less time on the steps of the Capitol at Washington, or in committee rooms, the United States would be building ships for the whole world. In one of the interests in which I am engaged we use exactly the same materials that the shipbuilder does; we use American labor, union labor, high-priced labor; we use protected steel, protected iron, protected lumber; we use protected paints and oils and varnishes, and everything that goes into a ship, and yet we are able to export our line of goods, and not only to build them for this country, but build them for the whole world. In this one industry which I represent, we exported \$23,000,000 worth of goods last year, produced out of the same materials, under the same circumstances and same conditions as the shipbuilding interests can work, and why they don't take hold in earnest to find ways to compete with the British shipbuilder I cannot understand, because we sell our goods right in Great Britain."

Mr. Metcalf's statement gives evidence of the fact that he himself is a typical American—a man who *does* things. There are American shipbuilders also who are *doing* things. They are building some of the largest ships ever launched, and we must confess that while we favor any movement to advance American interests, we cannot avoid thinking that Mr. Metcalf's view of action instead of talk will solve the problem, so far as active Americans like James J. Hill and others of his stamp and character have not already disposed of the subject.

OUR EGYPTIAN VISITOR.

ABBAS II, the Khedive of Egypt, appears to be the only ruler of the Old World who will visit America this summer in connection with the World's Fair at St. Louis. The young king sailed last month, and his arrival is awaited with interest. Abbas II has entertained many visitors from the United States, and the reputation comes before him to the effect that he is a thoroughly enlightened monarch. To his tutoring by an Oxford graduate may be ascribed the foundation for his subsequent progressiveness. Abbas II will find much to interest him—perhaps astonish him—during his tour of the United States, and judging by what we have

learned of him, the result cannot fail to be closer trade relations between Egypt and the United States. The Khedive will certainly receive a cordial welcome, and will be given every opportunity to study our methods and observe the progress which this country is making in the arts of peace.

In another column of this issue, and in previous issues, we have pointed out the need of better steamship communication between Egypt and the United States. The American Department of Commerce is investigating the question, and will doubtless soon make a report on the subject, but the solution of the problem is unquestionably the simple one of: More American ships. Perhaps the visit of the ruler of Egypt may awaken greater interest in this direction.

TELEGRAPHY BY TYPEWRITER.

SIXTY years ago last month the first telegraph message was successfully sent. All of our readers know how the system has grown in its usefulness to trade and how it has been improved; they know all about the developments in the direction of new ocean cables and the achievements of American and other inventors who have made wireless telegraphy more than a dream, even if they have not been able to put it into general commercial use. But really the most important recent discovery in this direction—one which will doubtless postpone, if it does not do away with, the necessity or commercial feasibility of the wireless for land purposes—is announced upon the occasion of the sixtieth anniversary of the sending of the first message. A report of the new invention is given on another page of THE AMERICAN EXPORTER.

The inventor is a prominent official of the principal telegraph company of the United States. He is a thoroughly practical man and his device is of the sort that we might expect him to produce. It is, in short, an improved typewriter, so arranged that any person who can operate a typewriter can send a message just as well as the skilled telegraph operator who works the key. By simply striking each typewriter letter the machine makes the necessary telegraphic dots and dashes. It is impossible to make a mistake, except by striking a wrong letter. The receiving instrument records the message automatically. We suspect that the inventor got his idea from the crude receiving machines, run with paper tape, on which telegraph messages were originally recorded in dots and dashes, before it was discovered that the ticks could be read by sound more quickly and with greater ease. However that may be the typewriter-telegraph will greatly simplify the business and add in that way at least to the progress of the age. It will, in fact, come mighty near to revolutionizing telegraphy.

WAR'S fortunes are not always on one side. Reports from the Far East show that last month Japan lost a battleship or two, sacrificing hundreds of lives, but in this case, as in that of the sinking of Admiral Makaroff's big flagship, the disaster came apparently from mines, and was not the result of open battle. At least, in neither case was there a battle or even an active engagement in progress. Whether the blows were struck by hidden mines or submarines, it is becoming more evident every month, if not oftener, that the massive battleships are floating coffins for their officers and crews, at least in times of war.

SHOES of American make are selling better than ever abroad and the trade in South America particularly is showing signs of substantial increase. Where American shoes gain a foothold, their excellent workmanship and reasonable prices invariably attract trade.

BEER as a beverage is showing increased demand in the United States. The manufacturers of one particular make, which is known to the importers of other countries, expect to put out more than 100,000,000 bottles of their best brand this year.

CONGRESS has adjourned without taking any action to extend the parcels post system. There seems to be a disinclination on the part of the United States legislators to turning the postal service into a bureau for the transmission of freight.

OUR GERMAN TRADE RELATIONS.

BERLIN'S American Chamber of Commerce is verifying the prediction which we made when it came into existence, that it would smooth rough spots in the interchange of commerce between Germany and the United States. Berlin's Chamber of Commerce has won its first victory in that direction and it is a notable one, for it involved the suspension of a United States Treasury regulation with reference to the filing of original bills of lading. The decision does not affect foreign imports of American goods, but the action taken is in the line of promoting amicable trade relations between two great countries and therefore is worthy of commendation. The Berlin Chamber had the active cooperation of the Hon. Frank H. Mason, our efficient and vigilant Consul-General at Berlin, and in thanking that official President Kreismann pays this tribute to American fairness:

"The result of the Chamber's protest to the United States Treasury Department, which we are pleased to feel was not without weight in determining the Department's action, has been widely noted in the German press as an evidence of the Chamber's readiness to serve both German and American trade interests, while the Department's broad-gauge view of the question is certain, in our opinion, to have a pleasant effect on the situation in Germany."

President Kriesmann sent the following appreciative message to Secretary Shaw, the head of the Treasury Department:

"In the name of the Board of Directors and of the members of the American Chamber of Commerce in Berlin I desire to express to your Department the appreciation of the German-American business community in this country of your action in ordering the suspension of the late ruling with reference to production of original invoices at United States consulates abroad. Your action is certain to be interpreted by German merchants and manufacturers as an evidence of the readiness of your Government to facilitate, by every legitimate means, the expanding commerce between the two nations, and this Chamber, as the active exponent of such expansion, is especially grateful for the broad-gauge view which your Department has taken of the matter in question."

WE consider this incident a noteworthy one, as showing the benefit to commerce of such organizations as the Berlin Chamber, as well as of the readiness of the United States Government to take prompt action in its administrative departments when it is possible to do so. We frequently receive communications from our subscribers abroad regarding what they consider inconsistent tariff laws or regulations. It is impossible for us to enter into tariff discussions, but we always investigate such complaints and call the attention of the proper officials to the matters mentioned. In most cases action by the Congress is necessary to change the conditions and the Congress moves slowly in its consideration of most subjects. In the executive branch of the Government, where it can be done without awaiting Congressional action, inequalities in trade relations with other countries are promptly and equitably adjusted by the United States administrative authorities. We have before us communications from several of our friends abroad, including one from our esteemed correspondent in Australia regarding the maritime regulations in relation to coastwise trade. In all of these cases it is impossible to do anything at present. The Congress is not now in session and will not be again in session until next December. The matters referred to in these communications can only be acted upon by the legislative governing body of the nation, and it is just as impossible to hurry the lawmakers in America as it is elsewhere on the globe. The American Government is actuated with liberalism and its best efforts will always be put forth to promote international trade. The people of the United States are not selfish, although they may seem sometimes to be so. They are law-abiding above everything else and when they encounter the effects of obnoxious laws they go to work to secure repealing legislation. That always takes time, but it is the only course open. Of one thing our foreign readers may rest assured: While the United States desires to promote its export trade to the fullest extent, it is equally anxious to secure the best that its foreign correspondents have to offer in return. Reciprocity is a cardinal word in the lexicon of Americans.

AMERICA'S WORLD'S FAIR.

ST. LOUIS is the scene at present of probably the finest exposition that has ever been given in the world. We have frequently anticipated the marvels which are on exhibition at the American World's Fair, but we have carefully avoided doing any advance bragging about its wonders. It is a real World's Fair. All of the nations on the face of the earth have participated, and consequently the magnificence of the exhibition is greater than even the promoters anticipated, although it must be admitted that their thoughts were even more than roseate. When it is printed that their expectations are more than realized little more need be said in that direction.

It is not our purpose to make comparison with World's Fairs held in other countries, but so many of our readers visited the Columbian Exposition in Chicago in 1893 that the differences between the two may interest them. The Chicago show cost \$20,000,000 and covered 640 acres, of which 82 acres were under roof. The present St. Louis fair, called the Ivory City, is so much greater that persons who viewed the Chicago fair will hesitate to believe actual facts, unless they have the good fortune to see for themselves what American enterprise and the friendliness of foreign nations have accomplished for the well-named Ivory City. The St. Louis fair has cost more than twice as much as Chicago's Columbian Exposition—in round figures about \$50,000,000. Its area is nearly twice as large, 1,240 acres, and it has under roof 128 acres, being 46 acres more than Chicago covered with buildings. This means a great deal when one pauses to think of the labor and expense of putting up one acre of buildings of the kind that must be built for a show of this description.

It is a gratifying evidence of international good feeling that more than sixty foreign nations are participating in the Fair. Of course, our own States and territories show up to their own advantage, but regardless of nationality or anything else except the broad principle of the best in civilization, it is worth the time of anybody to inspect the wonders of modern industry which are displayed. Elsewhere some account is given of the opening ceremonies, and from time to time our readers will learn more about the features of the Exposition that may be of especial interest to them.

COMMERCE between Cuba and the United States has already shown a material and gratifying increase, which seems to fully justify the wisdom of the adoption of the reciprocity treaty which went into effect between the two republics just prior to the 1st of January. While Cuba has benefited more in a way than has the United States, it is noteworthy that the total trade has already increased more than 70 per cent. Of this American exporters have to their credit only 25 per cent., the remainder of the gain being to the advantage of Cuba, but it must be remembered that the bulk of Cuba's exports to this country are in sugar, which does not interfere with home industry to any material extent. In agricultural implements, for instance, in the nine months which we have under observation at this time, the exports to Cuba were \$66,659, as against only \$29,164 in the corresponding period a year ago. Other articles of equal usefulness showed corresponding increases.

CANADIANS are showing more appreciation of the worth of American goods than ever before. Nobody knows better than Canadians what is worth buying, whether it be machinery, dry goods or anything else that is traded in on the markets of the world. The *New York Dry Goods Economist* recently published several pages of interesting matter on the subject, from which extracts are given elsewhere in this issue of THE AMERICAN EXPORTER. Our readers in other countries can safely place dependence on the good judgment of our nearest neighbors.

ELECTRICITY is invading more industrial fields. A new factory in the State of Maryland (U. S. A.), which has a capacity of 500 doors a day, depends entirely upon electric motors for operating its labor-saving and other machinery, using the motors individually and in groups. It is hardly necessary to say that the results are very satisfactory.

YOUTH, AGE AND BUSINESS.

SOME people, both at home and abroad, have adopted the idea frequently thrown out that this country's business world is essentially an aggregation of young men in point of age. These people do not seem to differentiate between persons who are prematurely old and others who grow younger as they become older. Almost everywhere in America—perhaps it is so in other countries—we can find men who are unable to obtain employment in positions for which they think they are fitted, who may have been left out apparently of the calculations of the reorganizers of firms or concerns for which they have worked, or who have come to the conclusion that the world is against them anyway; and why?—"because they are too old." Scores of cases of this sort have come under our observation. In the majority of cases the failure to obtain and hold employment has been due to several causes. Usually lack of interest in the work, unwillingness to conform to new customs, an inability to get out of the rut in which they have traveled, can be given as reasons why some men find it difficult to earn a living in the United States. These men are comparatively few, but their existence is a foil for the great army of others who do the best they can in humble positions, hoping to advance, and usually doing so unless they get into a rut. The men who get into a rut and are over 40 years of age invariably give "old age" as a reason for not retaining or being able to obtain employment. That reason is nonsensical. Lack of intelligent progressiveness is the real one.

It is true that young men are in control of affairs in the United States, both in its business life and its government. Some of these "young men" are 60 or 70 years old, according to their birth certificates, and there are other "young men" who are in the 80s and 90s who take part in the progressive control of great business concerns—men who may in the latter case not be physically as alert as they were years ago, but who are still enthusiastic in seeing and taking advantage of opportunities. Mentally they are as young as they ever were, and perhaps physically they are not much worse off than the man who can neither make, nor see, nor appreciate anything new. The question of age is really what each individual makes it. A man, barring accident or illness, is precisely as old as he feels. Take J. Pierpont Morgan, for example. Everybody has heard of him as one of America's prominent financiers. He had his 67th birthday last month, but he probably does not feel more aged than any man of 35 or 40. We have many men in important positions who are over 60. On the other hand, there are young men, in years as well as in enthusiasm, who hold prominent places, but as a rule they are subject to the counsel and advice of older men. It frequently happens that men of 35 or 40 will acquire such a grasp of affairs that they will be permitted to practically and apparently do as they please with great properties owned perhaps by older men—but young men who advance that far rarely permit themselves to forget their full duty and responsibility. They do as they believe the men whom they represent would do on every occasion. These "young men" make successes. While they are entitled to all the credit they receive, it would be unfair to deprive some of the older "young men" from their share..

In America the age and youth question is rarely raised, except by disappointed and unprogressive persons. They are few in number, but are self-assertive, as is the usual custom of persons with grievances. The fact of the matter is this: Every man is as old as he feels. The tendency of American progress is to make men younger if they fall in line with the spirit of the age. Most of them do, and the constant birth of new ideas, the flood of new inventions and the continual improvement of our manufactured articles all give good evidence that the drone cannot prevent "the survival of the fittest," nor can he block the wheels of American trade either at home or with our foreign customers. The drone is not worth attention really, but, like the insects, he comes to annoy all sorts of folks at times—never, however, with any harmful result.

On the whole the drone serves a useful purpose, for by comparison he illumines the successes of those who are not in his category and thereby unwillingly and unwittingly perhaps contributes to the general good of humanity.

OUR PROGRESSIVE MANUFACTURERS.

ONE of the oldest and largest manufacturing concerns in the United States, its origin dates back to 1843, is making a move that is interesting to students of the growth of American trade at home and abroad. The concern produces articles that are in general demand throughout the world and it has acquired a reputation for turning out only first-class machinery for the trade regardless of where the customers may be located. Its central point of manufacture at present is in Brooklyn, a suburban borough of the big city of New York. Within this year all of its manufacturing will be done at its new works, in the neighboring State of New Jersey. The moving of a big manufacturing plant involves the expenditure of much money and causes considerable trouble that cannot be estimated from a financial standpoint. Such a step is only taken by great concerns when it becomes imperative and in this case it has been forced primarily by the excellence of the products put on the markets of the world by skilled and intelligent American workmen; secondarily, by the rapid growth of New York City and the enhanced values placed upon real estate within its confines.

The present plant in Brooklyn covers five acres of land. Attempts that were made to secure more land were met by the higher prices that the increase of values made inevitable. This was only two or three years ago, but the export business of the company showed evidence of becoming too great to handle with the facilities then available. Temporary expedients were resorted to and the managers meanwhile figured on their necessities. They bought thirty-five acres of land in New Jersey and their new shops are now nearly ready for occupancy. These shops cover very nearly all of the ground. The jump from five acres to thirty-five acres of shops is a big one, but taking into account the cramped quarters now used, the necessity for having work done away from the home plant and allowing for the natural growth of business, the increased facilities will be found none too large for the purposes for which they are intended. In the new location enlargements will be possible without prohibitive prices for either land or factory purposes or for homes for the new mechanics who will have to be employed.

The managers of the concern in question faced a difficult problem. Their motto was that of giving the best goods for the least money, allowing for a reasonable profit. The move from New York to New Jersey will cost many thousands of dollars, but the managers figure that the change will enable them to recoup the expense and slightly lower the price which they place upon their products, without decreasing the wages of their workmen or permitting a deterioration of the quality of their goods. Perhaps we have said more than we ought to say about the progressiveness of this particular concern, but it is so much in line with the policy of American manufacturers generally that we believe our foreign readers will be interested in such observations as we have made.

PROBABLY the largest single municipal loan ever negotiated was the sale last month of \$37,000,000 of the 3½ per cent. bonds of the city of New York. New York's debt is enormous, its government is so liberal that it is sometimes called extravagant, but the faith of the men of money in its present stability and its future prospects is so great that more than \$250,000,000 was represented in the bids that were made for the securities. New York City, commercially and otherwise, is doing very well, thank you, when she asks for \$37,000,000 and is offered \$250,000,000. We commend this great loan to the attention of those European critics of our country who are inclined to decry our institutions and methods and who say that we are going to the "demnition bow wows" in our state and municipal affairs.

VARIOUS reports have come by cable from the Far East regarding the destruction of the Czar's \$20,000,000 magic city of Dalny. We are in doubt as to whether the entire city has been destroyed, or whether only the harbor improvements have been razed with dynamite. In any event, the wreckage done is much to be regretted. It is another argument against war.

THE GREAT PORTS OF THE WORLD.

LONDON is to-day the first port in the world in tonnage entered, but according to recent statistics, which have official indorsement, New York is a close second. London is the largest city in the world, and naturally would be expected to show the largest tonnage, which is 10,179,023. New York is now unquestionably the second largest city in the world, and ranks second also in tonnage, but its 9,053,906 tons show that it is much closer to London in point of commerce than it is in population, while Liverpool, which once ranked second in commerce, has dropped back to sixth place, where it is closely pressed by Rotterdam and Marseilles. After New York comes Hamburg, a close third, with 8,689,000 tons, and Antwerp is fourth, with 8,425,127. Hongkong claims fifth place, with 8,253,591, not counting junks, while Liverpool, in the sixth place, has 6,843,200. Commenting upon these figures, the *Tribune*, of this city, says:

"An impressive indication of New York's vast superiority over other American ports is in the fact that, while New York stands an easy second on the world's list, the next American port, Boston, is away down in the twenty-first place, being surpassed by Lisbon, Buenos Ayres, Algiers, Havana and others, while the third American port, Philadelphia, can claim no better than the thirtieth place, below Barcelona, Yokohama and Bordeaux. Our fourth is New Orleans, in the forty-first place, below Gothenburg, but above Montreal; while Batimore, in the forty-fourth place, between Odessa and Valparaiso; the Puget Sound ports, in the fifty-second, and San Francisco, in the fifty-eighth place, complete the list of American ports among the largest sixty in the world.

"It is especially gratifying to make this record concerning New York, because for years past we have been striving for the removal of unwarranted handicaps upon New York's commerce and for the establishment of those reasonable conditions which would promote its growth. It is well to be believed that if proper harbor improvements were effected, if inland routes of access to New York were fully utilized, and if the general port facilities here were made what they should be, the next decade might see New York not the second, but the first port of the world."

There can be no question of the fact that the improvements referred to in the *Tribune* will be carried forward with all possible diligence. The port facilities of New York are being constantly and continually augmented, and if our esteemed contemporary came closer into contact with actual trade conditions, instead of depending upon statistics, the last paragraph of the editorial would have seen some slight changes, for the work of upbuilding the port of New York is going on right along, and quite vigorously, it may be added.

DOMESTIC extension of the parcels-post system has received a serious setback in the United States, so that our friends living in foreign countries which have treaty relations with this Government are better off in this respect than some of our own people. We have always been of the opinion that there was more merit in the parcels-post system for international purposes than for use at home. In the United States there are so many other convenient ways of dispatching small parcels at low rates that it has not seemed to us really necessary to burden the United States mails with matter which would be given to it for transportation under the parcels-post system. For the purposes of international trade the facilities are not so adequate, and our exporters find the system in effect with treaty countries to be both convenient and useful.

WORLD'S fairs seem to be a feature of international life and commerce. This year America has the stage, and the success of the exposition at St. Louis will make it necessary for the next country that indulges in such luxuries to put forth herculean efforts to eclipse the wonders of the Ivory City.

GERMANY'S creation of three new consulates in the American cities of New Orleans, St. Paul and Seattle is taken to mean a fresh recognition of the growing importance of Germany's commercial relations with the United States.

AMERICAN DRILLING MACHINERY.

WHILE Japan and Russia are in the throes of war it is interesting to observe that the pursuits of peace are not altogether neglected in the zone of martial activity. As noted elsewhere in this issue, the water supply of Russia's defenses was constructed by American mechanics with American machinery and much of the machinery used in building her citadels at Port Arthur and Vladivostok was sent from the United States. It is chiefly the water supply which is of momentary interest, for, while Russia stopped operations in this direction when hostilities began, the drilling with American machinery for both water and oil has gone on in Japan regardless of the war.

In Russia, also, outside of the localities affected by the strife, similar activity continues, and in many sections of the Far East our drilling machinery has long been in appreciative demand. This branch of the American manufacturing industry has been carried on quietly, but nevertheless energetically. As a result it may be said that wells are being drilled somewhere on the earth at every moment of time, for users of our machinery are in every quarter of the globe and American drills are everywhere at work penetrating the crust of our planet.

Our competitors abroad have never yet been able to excel American machinery produced for this purpose, and the constantly increasing demand is evidence of the fact that the efforts of our inventors and manufacturers to give the best goods that can be produced for the money are thoroughly appreciated by people everywhere who have occasion to bore for oil or water—as well as those who require other articles in the production of which our artisans have wrought wondrously well.

EDUCATIONAL effort is not lost sight of by American trades unions. Nearly all of the national bodies have their own magazines to spread information and suggest new ideas to their members. We learn that the cost of these organs to some of the larger organizations is as follows, per year: *Garment Workers' Weekly Bulletin*, \$32,000; *International Steam Engineer*, \$40,000; *Shoe Workers' Journal*, \$25,000; *Bricklayer and Mason*, \$25,000; *Locomotive Engineers' Journal*, \$33,000; *Locomotive Fireman's Journal*, \$55,000. In one case the advertising patronage is \$40,000 a year, offsetting the cost, while some of the magazines are profitable business enterprises, although the object is not to make money, but to keep the rank and file of the organizations fully informed upon all matters concerning the unions and of interest or benefit to them in their daily pursuits. In fact, the aim is to do constant educational work, and its result is shown in the good work—better work than ever before—that is being done by American mechanics. Foreign purchasers of our products are the final beneficiaries of this campaign of intelligence.

NEW YORK is to have a new \$2,000,000 post-office, and the building will be placed over the underground railroad terminal of one of the greatest transportation systems in the United States. Nobody can now doubt New York's onward progress, if anybody has been tempted to do so.

AMERICAN financiering is shown at its best in the story on another page about the payment of the \$40,000,000 for the Panama Canal. The United States Government managed the payment so carefully that it did not make even a ripple on the financial pool.

COTTON cultivation in India shows a development that will doubtless attract the attention of American manufacturers who supply implements used in this industrial field. More than a million acres are being cultivated this season in addition to the acreage of a year ago.

EUROPEANS will have a chance to meet John Mitchell, who conducted the great American coal strike more than a year ago. He will go to Paris next August as a delegate to the International Mining Congress.

A REAL WORLD'S FAIR.

America's New Exposition Opens Auspiciously and Is a Success from the Start.

AMERICA'S \$50,000,000 World's Fair has been opened and continued in successful operation during the month of May. The inaugurating ceremonies were held too late for adequate notice in our May issue, but the Exposition is of so much importance to international trade that some features of the opening are herewith given to our readers. A complete account of the opening would crowd out of this issue the many other items of information that our readers expect every month. The ceremonies were appropriate and impressive. The Exposition was planned to commemorate the purchase of the territory of Louisiana, the greatest step, to use the words of Mr. Roosevelt, the President of the United States, in "the movement which transformed the American Republic from a small confederacy of States lying along the Atlantic seaboard to a continental nation." President Roosevelt, in the national capital at Washington, by means of touching a telegraph key, gave the signal which set the machinery in motion and started the big Exposition in St. Louis, hundreds of miles away. It was significant of the control over force and distance that the touch of the President's hand set in motion 40,000 horse-power of machinery, 800 miles away, without hitch or delay. There were many speeches made on the occasion of the opening. The President, at the ceremonies at Washington, which were witnessed by all of the foreign diplomats who did not go to St. Louis, said in part:

"I wish now to greet all present, and especially the representatives of the foreign nations here represented, in the name of the American people, and to thank these representatives for the parts their several countries have taken in being represented in this centennial anniversary of the greatest step in the movement which transformed the American Republic from a small confederacy of States, lying along the Atlantic seaboard, to a continental nation.

"This Exposition is one primarily intended to show the progress in the industry, the science and the art, not only of the American nation, but of all other nations in the great and wonderful century which has just closed. Every department of human activity will be represented here, and, perhaps, I may be allowed, as honorary president of the Athletic Association, which, under European management, started to revive the memory of the Olympic games, to say that I am glad that in addition to paying proper heed to the progress of industry of science, of art, we have also paid proper heed to the development of the athletic pastimes which are useful in themselves, which are useful as showing that it is wise for nations to be able to relax as well as work.

"I greet you all. I appreciate your having come here on this occasion, and in the presence of you, representing the American Government and the governments of the foreign nations, I here open the Louisiana Exposition."

At St. Louis the opening ceremonies were witnessed by an enormous throng, the city and Exposition grounds were bedecked with holiday attire, flags and bunting were everywhere displayed, and foreigners and American citizens vied with one another in contributing by their enthusiasm to the success of the first day of America's greatest world's show. President Francis, of the Fair, in his address, said some things that will interest our readers, if any of them wish to emulate this example. In part he said:

"Six years have passed since this conception began to assume form. The first year was devoted to arousing the interest of this community and securing the cooperation of the States and Territories of the Purchase. The next two years were spent in enlisting the sympathy of other sections of our own country and in gaining the recognition and assistance of the general Government. Three years ago the work of preparation was begun. It has been vigorously prosecuted in every section of the globe. The movement has changed in scope from day to day and taken on more definite shape from year to year.

"Discouragements were frequent enough, but were never disheartening, and are now all forgotten. We remember only the words of cheer and commendation, the patient consideration given to what was often looked upon as misdirected enthusiasm, but which was persisted in, and almost invariably converted indifference or scepticism into helpful and active interest.

"The magnitude of the enterprise was never lost sight of by its promoters, but its mammoth proportions, constantly increasing as they developed, never for a moment shook the confidence, weakened the energies or diverted from their well-defined purposes those who had been entrusted with the responsibility and the work. To-day you see the consummation of their efforts.

"The sincere and helpful interest of the Federal Government, the unanimous cooperation of the States and Territories and possessions of the United States, the participation of almost every country on the earth, is evidence of the wisdom and thoroughness of the work of exploitation and establishes unquestionably the universal character of the Exposition.

"It will have a place in history more conspicuous than its projectors ever conceived. For more than a generation to come it will be a marker in the accomplishments and progress of man. So thoroughly does it represent the world's civilization that if all man's other works were by some unspeakable catastrophe blotted out, the records here established by the assembled nations would afford all necessary standards for the rebuilding of our entire civilization.

"By bringing together sections and peoples hitherto remote and unacquainted, and thereby promoting mutual respect, it is a distinct step toward establishing that universal peace for which all right-minded people are striving,

and which the Exposition's gifted sculptor has so fittingly typified in the graceful figure that crowns the noble monument at whose base we stand."

Other speeches were made in the same strain, and the Exposition was soon in full blast. It has been a success from the start. There was less uncompleted work—there is always some—than has ever before been observed in a world's fair. People who have been present at the opening of world's fairs for a quarter of a century complimented the executive officers of this one upon the nearness to perfection which they had achieved.

As is generally known the cost of construction, etc., is about \$50,000,000. A visitor unacquainted with American methods would be inclined to doubt if the cost could be kept within that figure, large as it is. To give our readers who may not be able to visit the big fair some idea of the attractions it may be said that the main portion of the Exposition grounds is occupied by the ten large exhibit palaces, as follows: Liberal Arts, Mines and Metallurgy, Manufactures, Education, Agriculture and Horticulture. In addition to these, is the group of permanent stone structures erected for the display of art at a cost of \$1,000,000, located at the rear of the Cascade Gardens, behind Festival Hall; the Washington University buildings in the western part of the grounds, which cost \$1,000,000, will be utilized by the Exposition until its close, when they will be turned over to the Washington University.

Skirting the northern boundary of the Exposition for almost a mile is the street of concessions, lined on both sides by buildings containing various attractions, erected at a total cost of \$5,000,000 by concessionaires. This street has been officially termed "The Pike," and corresponds to the Midway of the Columbian Exposition at Chicago.

Our readers will be kept fully informed of the progress of the fair.

Marconi's Latest Wireless Successes.

SIGNOR MARCONI, who arrived in New York last month on the trans-Atlantic liner *Campania*, said that during the trip from Liverpool he had been able to communicate, by means of his improved wireless apparatus, from mid-ocean with both sides of the Atlantic. Last October, during an eastward voyage on the *Lucania*, Mr. Marconi received messages from the land stations during the entire voyage, and now he will, under contract with the Cunard line, install instruments on all of its vessels for both sending and receiving messages all the way across the ocean, so that newspapers containing the latest news of the world can be printed on board every day.

On the *Campania* Mr. Marconi had a stateroom on the port side of the vessel, and in it he installed his key, the wires leading to the truck of the foremast. On leaving Liverpool the vessel was put into communication with the shore stations at Poldhu, Seaforth Sands and Crookhaven. During the voyage the vessel logged 3,158 knots. According to his statement Mr. Marconi continued to send messages to the Poldhu station until he was 1,700 miles at sea. After the vessel has passed the 1,500-mile mark he sent messages to Cape Breton, cutting off Poldhu after 1,700 miles. Everything sent to the land stations was received, and the only mistake made was in the name of Gen. Sir H. C. Wilkinson, a passenger on the *Campania*, whose name at a distance of 1,000 miles was received "Wilson."

Mr. Marconi was very enthusiastic over his success. "My recent voyage," he said, "was taken for the purpose of testing a combination of the best points of four keys, the new instrument having the greatest range of anything of its kind ever made. We kept in communication with Poldhu for 1,700 miles, which, you see, is more than half seas over, and then we started on Cape Breton, and kept talking to that place during the rest of the voyage. So we were in communication all the way over.

"My next experiment will be that of girdling the globe by means of instruments on vessels at sea. The British Government has placed several of its warships at my disposal, and the next three months will be devoted to fitting them with the long-distance keys and receivers. Then they will be stationed at different points around the world, and I shall try to pick each one up in succession. The only instruments that can take our messages are those keyed up just as ours are, and to do that is so nearly impossible that I say it cannot be done."

Powerful Toys of Wealthy Americans.

IT is becoming a fad with some rich men in America, according to *Motor Age*, to establish automobile racing stables much on the lines of horse-racing stables, except that the gambling features of the latter are not possible. Fast automobiles are purchased and turned over to hired drivers to be raced for glory and cups. The owner gets the cups and the maker and driver of the car get the glory. It is hardly possible to see how a man by simply playing the check-book rôle becomes an active part of the automobile racing game. He may do it good by supplying entrants. Soon he will not be needed. What is he in it for? Presumably not as a philanthropist, contestant or for personal credit. It must be for the sake of pride of ownership of a good thing. His racing success is *his* car; he paid for it. Some one else designed it, built it and drove it. He bought it. Like the child with a new toy, hugged tightly, the right of possession is strong in him. It is his little fad to be the possessor of winners. These rich men contribute something to the practical progress of the world, for they keep American inventors and manufacturers busy seeking new ideas and constructing new appliances, many of which aid in the advancement toward perfection of the commercial automobile.

James J. Hill—A Successful American.

OUR foreign readers have only recently heard of James J. Hill, the American financier who has the courage to build giant ships for our export trade without Government subsidy. Mr. Hill is a most interesting man, aside from what he is doing to advance the interests of international trade, and some account of his career is worth giving to our readers, as showing how an ordinary clerk in America—if he becomes inoculated with the forward movement of affairs—can within a comparatively few years order the construction of the largest freight steamships afloat for foreign trade, in addition to making a fortune out of judicious railroad investments. Mr. Hill's success is typical of American progress. An entire issue of THE AMERICAN EXPORTER could be filled with his achievements, and some of them, including the building of the new trans-Pacific steamships Dakota and Minnesota, have already been chronicled in these columns.

At first a shipping clerk for a steam packet line running on the Mississippi River, Mr. Hill then organized a steamboat line of his own, which ran up the Red River of the North and brought back furs which before that time had crawled southward in curious two-wheeled carts. Mr. Hill was the first man to bring coal to the city of St. Paul. It came up the river in steamboats in which Mr. Hill had acquired an interest.

They were talking railroads and building them, too, in those days. A lot of Dutch capitalists dropped \$30,000,000 in a little line called the St. Paul and Pacific Railroad. With the aid of Canadian bankers Mr. Hill bought up the bankrupt road and announced that eventually he should build it through to Puget Sound. Citizens laughed, for just to the south was the Northern Pacific, aided by enormous Government grants, while to the north the Canadian Pacific was being rushed through to the coast with large Government aid.

It took time to force the road westward. Out in Dakota when Mr. Hill took hold in 1879 the settlers were few and far between and badly discouraged. From the first Mr. Hill had blazoned on his banner the motto "Develop the country."

"It was years ago," said Mr. Hill recently, "that I made up my mind that something must be done to keep the people along our lines from being forced to depend upon a single crop. They were all raising wheat. Sometimes wheat failed, and then there was the devil to pay. I bought about 900 polled Angus and shorthorn bulls and as many thousand blooded swine, and distributed them among the farmers all along the Great Northern. That got the people interested in stock-raising. As a result, I believe the Great Northern Railroad (which Mr. Hill controls) handles more cattle and hogs to-day than any road running into St. Paul."

At the start the Hill road found a certain market on the Pacific coast for Eastern products, but there was nothing which the Pacific end produced that could be shipped East at a profit. Consequently the Hill road was forced to pull empty freight cars back from the Pacific to St. Paul. The great products of that section then as now were lumber and shingles. The freight rate then on lumber from Puget Sound to Lake Superior was 60 cents a hundred. At that rate there was no profit in it to the shipper and the lumber did not come East. Mr. Hill wanted that lumber to fill his empty eastbound freight cars. He said to the lumbermen:

"What rate shall I make you in order that you may make the business of shipping lumber East a profitable one?"

The lumbermen asked for a rate of 50 cents. Mr. Hill laughed at them and made it 40 cents. From that time on the shipments of lumber from Washington, on the Pacific coast, to Lake Superior, in the center of the United States, increased enormously.

It became necessary to find a market for products which could fill those empty westbound freight cars. Where was the market to be found? Mr. Hill has the mind of a dreamer, and, as a friend put it, he makes his dreams come true. He simply jumped across the Pacific Ocean and found his market in Japan.

Now the people of the Northwest Pacific section of the United States are talking of little else than the possibility of their Napoleon finally meeting his Waterloo in view of the war. And the little, short, broad-shouldered, deep-chested man, with his immense head, bald on top and in front, and thatched at the sides with a thick crop of long iron-gray hair, sits at his desk in the president's office of the Great Northern system puffing at a black cigar, pulling at his short, roughly trimmed gray beard, and talking now with a wheat farmer from North Dakota, now with a fruit shipper from the Columbia Valley of Washington, and then turning to discuss the situation with some of the great railroad financiers of America who have been made to feel his power.

To talk with James J. Hill is to get an impression of immense vitality, of tremendous and unshaken will, which makes the thought of his possible retirement seem little less than ridiculous. He has in him all of the native-born enthusiasm of the true American citizen. He sees opportunities and does not hesitate to embrace them. No matter what the result may be of the Japanese-Russian war, he has provided ships that will be needed for the trade between the United States and the countries involved.

Using American Machinery.—It is said that the largest shoe factory in France uses only American machinery. The growth of this manufactory is phenomenal. Before the Paris Exposition of 1900 this factory was a very small one, employing only French machinery. Since then it has increased, until it is now the largest in the Republic.—*American Machinist.*

Big Tunnel for Pacific Coast Port.

AMERICA'S metropolis, New York City, is not to have the monopoly of big tunnels. The Pacific Ocean front of the United States is striving to equal, if not eclipse, the efforts of the dwellers on the Atlantic coast, and James J. Hill's tunnel for Great Northern Railroad trains underneath the city of Seattle is expected to show the world the growth and enterprise of the western section of the country. It is more than half completed, and by October it is expected cars will be running through it, greatly relieving the congestion on the water front. A definite date has been set for the completion of the Northern Pacific and Great Northern terminals in Seattle, and the finishing of the big union station. Within two years at most all these big improvements will be completed.

The peculiar topography of Seattle made the tunnel a necessity, for the hills descend abruptly into Puget Sound and leave very little space for railways along the water front. From a broad area of tidelands in the southern part of the city, where the Great Northern terminals will lie, the tunnel penetrates the elevation almost on a level with the water and emerges above the heavy shipping district in easy access to the Hill Oriental docks and wheat warehouses at Smith Cove.

The tunnel passes the greater part of the way 200 feet beneath Fourth avenue, then bends toward the bay and goes directly beneath many large buildings. One five-story building was affected by the tunnel work and condemned. The structure will shortly be torn down. Otherwise the tunnel has produced no ill effects.

When the tunnel is completed it will be the largest in the United States, in point of diameter, and but one in the world, and that in Europe, will exceed it. In connection with the tunnel operations the city is preparing to open streets and make the union station the foot of a broad thoroughfare extending for miles through Seattle to the northern suburbs. The buildings will be among the handsomest passenger railway stations in the United States.

Seattle comes next to San Francisco as our great Pacific coast port, and in the last few years has been making marvelous advances in its export trade position. San Francisco will have to maintain, if not increase, her energetic business efforts if she desires to keep Seattle in second place. Seattle is certainly becoming a great railroad terminal, and its ocean trade facilities are being constantly improved. Costly tunnels, new wharves and a spirit of enthusiasm that is natural to American merchants all tend to point to greater cities for this gateway between the United States and the Far East.

To Print Music with Typewriters.

MUSICAL typewriters, which do not make music directly, but which will contribute indirectly to the production of melody, will soon be on the American market. A company has been formed, with \$200,000 capital, and orders have already been received for 200 of the machines. The typewriter has been put to practical tests, but whether composers of music will take kindly to it or not, it is likely to prove invaluable to persons who have to copy the written scores of composers. This new musical typewriter is said to be a marvel. It registers the notes, bars and rests and, in addition, makes lines as it goes along the staff lines. Under the present system the cost of a single machine is about \$300, but it is thought that this item may be reduced at least \$100 when the factory is in running order. The machine resembles the ordinary typewriter, except that, in addition to performing the duty of registering characters, it forms the scale as the writer proceeds with his work. It is quite probable that the typewriter will simplify the production of music for publication, for the typewritten scores could be reproduced by the usual processes of duplication if not enough copies were required to warrant the expense of printing the same.

Progress of Civilization in Asia.

A WRITER in the *Century Magazine* says that the products of American mills and factories are to be found in all parts of Asia and Africa.

He writes: "The knowledge of modern inventions of new foods and articles has created new wants. The Chinese peasant is no longer content to burn bean oil; he wants kerosene. In scores of humble Laos homes I saw American lamps costing 20 rupees apiece, and a magistrate proudly showed me a collection of nineteen of these shining articles. The narrow streets of Canton are brilliant with German and American chandeliers, and myriads of private houses throughout the empire are lighted by foreign lamps.

"The desire of the Asiatic to possess foreign lamps is equaled only by his passion for foreign clocks. The demand for clocks is insatiable. I counted twenty-seven in the private apartments of the Empress of China, and my wife nineteen in the bedroom of the Empress Dowager, while cheaper ones tick to the delighted wonder of myriads of humbler people."

American Opportunities in Italy.—While the field does not seem inviting for the sale of American railway and telegraph supplies, I venture to suggest that it would be well for our large manufacturers to send expert agents here to practically view the situation. In other lines of goods, such as sewing-machines, cash-registers, typewriting-machines, sausage-grinders, etc., American products have practically the monopoly of the trade. Vigorous efforts, low prices and long-time payments might result in capturing some of the trade in the line of railway and telegraph supplies.—*Pietro Cuneo, United States Consul, Turin, Italy.*

Double Engine Traction

In **THREE** Sizes:

20 H. P.	-	Weight, 9½ Tons
25 H. P.	-	Weight, 10½ Tons
30 H. P.	-	Weight, 11¼ Tons

Boxing for Export will increase weight 20 per cent.

Hauling Capacity, - 15 to 25 Tons,
BESIDES FUEL AND WATER.

These Engines Always Give
Maximum Power.

Where the reduced speed
of a single engine will stall
it, the Double Engine
walks right along.

Wheels (22 to 28 inch face)
shown are for Threshing
and Plowing Traction.

Special Wheels
for Freighting.

Boilers are of ample size.
With indifferent fuel under
severest stress will blow off.

Engines on "belt-brake"
show easily 40 to 60 per
cent. increase in power over
above rating.

A REMARKABLE RECORD!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time "turned out" an average of **Five Washers per day**. During the month of August, 1903, we manufactured and sold **OVER FOUR HUNDRED Washers per day**.

A REMARKABLE RECORD!!!

REWARD OF MERIT!!!

REWARD OF MERIT!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment**, but by the adoption of our **agitator** tosses and tumbles the garment through a **whirlpool of water**, thus **forcing the water through the finest or coarsest fabrics**, causing the clothes to become **ABSOLUTELY CLEAN**, without boiling or scrubbing, without wear or tear, and without the use of chemicals.

SPECIAL OFFER FOR FOREIGN MARKETS ONLY:

\$22.75 Upon receipt of **Twenty-two Dollars and Seventy-five Cents** in U. S. gold, or its equivalent, we will box, ready for steamer, and deliver **F. O. B. cars at New York City, One of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-BEARING WASHING MACHINES.** Weight of the four machines, boxed, 300 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us duplicate of order. Our Illustrated Catalogue mailed postpaid.

The "1900" WASHER COMPANY

BINGHAMTON · NEW YORK · U.S.A.

WIRELESS AUTO THE LATEST.

Automobiles Between Which Telegrams May Be Sent in Army Service Shown at World's Fair.

UNIQUE as an instrument in modern warfare is the wireless telegraph automobile which is exhibited in the Palace of Electricity at the St. Louis World's Fair by an American wireless telegraph company. By using these vehicles army corps, divisions, brigades and regiments may keep in constant communication, no matter how far apart they may be. A general commanding, stationed perhaps fifty miles to the rear, can converse with the officer who is directing movements on the firing line, and the next instant can speak with those who are leading the reserves another fifty miles from the scene of action. He may be so far distant that not the sound of a rifle reaches his ears, yet the click-click of the instrument that is at his elbow in the automobile tells the progress of the battle.

These "wireless automobiles," as they are called until some simpler name can be coined, are remarkable for the tall glass case that rises from the center and in which is confined the operator. This case is about six feet high and two feet square. Through a hood projects a brass rod for another four feet, and the rod terminates in a round knob about three inches in diameter. Glass, being a non-conductor, prevents the currents of electricity which are ever present in the air from affecting the delicate instrument, and only the current to which the apparatus is attuned comes to the knob, then down the rod and creates the sound which takes shape as letters, then as words.

When one thinks of the army of men that in recent wars have been detailed from the active fighting forces to dig holes for telegraph poles, erect the poles and string the wires, not to mention the horses and mules that have been required to haul these accessories into the field, the tremendous step forward in the way of conserving strength of the units is obvious. Again, when wires and poles are used, great financial loss follows defeat, for the enemy captures the equipment that has been placed in position after weeks and perhaps months of labor. But the "wireless automobile" can dash from the scene of action the moment a recall is sounded and take position well in advance of a retreating column.

Two men are sufficient to man one of these novel accessories to an up-to-date army corps—a chauffeur and an operator—although space has been arranged for three persons and the third may be an orderly who will carry aerograms to the commanding officer, or the commanding officer himself.

The speed at which these automobiles travel depends, of course, upon the condition of the roads, but they are so powerful that even on cross-country routes they can make ten miles an hour.

The glass case, within which the operator sits, is collapsible, and when the auto is moving from place to place it can be taken down and stored in a compartment at the side. These novel instruments have not been tried as yet in actual warfare, although it is expected that they will be in the near future, as the Japanese Government has recently purchased several of the machines. They have, however, stood the test in army maneuvers, and by means of two machines, stationed forty-eight miles apart, uninterrupted communication was kept up during an entire day.

The American De Forest wireless telegraph has stood the United States Government test and the system is being introduced in the armies and navies of this country and Great Britain. It is being used to-day on the London *Times* and New York *Times* scout boat Haimun to send dispatches from the scenes of the Japanese-Russo conflict.

Trackless Trolley Cars Coming Into Vogue.

A NOVEL passenger car is to be used on the street railways in the neighborhood of Overbrook, a suburb of Philadelphia, U. S. A. Two of the new vehicles are now being built by Alfred J. Wildman, an automobile manufacturer. The cars resemble so closely the ordinary trolley car in appearance that many people actually believed that they were to be run on the suburban trolley tracks. Lewis Jones, of Philadelphia, who has had a number of automobiles built at Wildman's works, is the man back of the auto-street car service, which, it is understood, will include several points in and around the suburbs of Philadelphia.

The car bodies are each eighteen feet long—just the length of the average single-truck closed trolley car—six feet six inches wide (about the same as the old horse car) and seven feet from the floor to the roof. The windows are of the same type as used in the local street cars, and will be removed in summer, instead of dropped or raised. There will be seven windows on each side, and the ends will each contain three large windows. The entrance will be on the right-hand front end, and the motorman will be located on the left side, so that he will be able to take up the fares of the passengers, either when they enter or leave the car.

The front will be entered through a vestibule, and there will be a center aisle in the car. Upon the right side will be double seats, of the kind used in trolley cars extensively. Double gasoline engines of forty horse-power will drive the car, at varying speeds up to twenty-five or thirty miles per hour. The car will be lighted from the dynamo, which will act as spark for the gasoline engines.

While every effort has been made to keep the cars as light in weight as possible—the body weighing less than a ton, complete—the finish is very thorough. Steam car roofs and straight sides have been introduced, and practically every feature of the average coach has been retained. The braking

will be accomplished through powerful gearing, worked by the foot of the motorman.

This will be the first attempt in this country to operate an automobile street car service with cars approaching so near the street car type, and it will doubtless arouse a great deal of interest. It is possible that the automobile line will be able to outrun the trolley lines, because of the ability to dodge vehicles in front of its cars and the general apathy to high-speed automobiles in suburban districts. The electric railway companies do not look with kindly eyes upon the advent of automobile car lines, because of the conditions under which the latter operate.

No expensive power-house, with miles of copper feed wires, are necessary, and there are few restrictions of any note. It is not necessary to keep any roads paved or bridges in repair, and, finally, if the route doesn't pay, it can be abandoned, with no loss of valuable material.

One of the leading electric railway publications of the country recently sounded a warning in regard to the possible growth of automobile car lines, and said that the electric railway companies should insist upon equal rights with the automobile companies or else compel the autos to come under the same restrictions as the trolley companies.

There promises to be an interesting fight ahead, and the electric railway companies of the United States, with a rapidly growing system which bids fair to some day extend from ocean to ocean, are not likely to sit idly by and see all the good things snapped up by the automobile companies.

American Shipbuilder on Gas Engine's Future.

WRITING under the title of "The Superseding of Steam Power," in the June *World's Work*, Lewis Nixon, an American mechanical and shipbuilding expert, says: "I have been led, lately, to think the whole development of the steam engine, to the exclusion of the gas engine, has been a mistake, and that we are now at the beginning of a new era in the use of power. Engineers could to-day gain better and more economical results by abandoning steam and using internal combustion engines, even in large establishments. The gain in economy of fuel will advance with the size of the establishment. With the internal-combustion engine, a brake horse-power can be produced on a pound of coal. This could not be done with steam under any conditions.

"So great a revolution has come about in methods of producing power that a 10,000-ton cruiser of twenty-one knots an hour could to-day proceed around the world at fourteen knots without taking on fuel and without sacrificing any of her war efficiency. New kinds of engines have come into vogue, which suggests facts larger even than this.

"Oil engines using crude petroleum will be developed as soon as the demand is felt for them, but, even here, the fuel can be made into gas and burned thus with far greater economy than is possible when the oil itself is burned under boilers, or gasoline can be used. In an ordinary 3,200-horse-power torpedo boat, forty-three tons of coal would be used in ten hours.

"With gasoline, the radius of activity of the same torpedo boat can be more than quadrupled, for 3,200 horse-power can be produced from 3,200 gallons of fuel. Briefly, 16,000 pounds of gasoline will do the work of 96,000 pounds of coal. The cost of the fuel is higher, but with a gasoline plant in a torpedo boat, only two men are required in the engine room, and none at all in the fire-room. The dangers of steam at high pressure are avoided, and the complexity of steam machinery done away with.

"Owing to the certain saving to be secured in coal consumption and to the simplicity and reliability of the gas-engine plant, we shall witness a gradual forcing out of the steam plants in future power plants for lighting, pumping, or factory use, and it will be a question of but a short time before many of the existing steam plants will be replaced.

Lieutenant Nixon omits to mention American hot-air engines, but many of our readers who are using them will do a little thinking-as to the equal possibility of expansion in that line, for the hot-air engines are invariably as good as gas engines and better, perhaps, for some purposes.

Making Mechanics by American Apprentices System.

SINCE January 1, 1901, at which time the present system of apprenticeship of the Baldwin Locomotive Works Company was inaugurated under the supervision of N. W. Sample, there have been indentured 545 apprentices. The total number of apprentices carried on the shop rolls at the close of the year 1903 was 379, of which number 345 are machinists, 5 blacksmiths, 5 brass finishers, 10 molders, 12 pattern-makers, 1 boiler-maker and sheet-iron worker. In addition to indentured apprentices there are 23 special apprentices, largely from foreign countries, 1 being a native of Finland, 1 of Costa Rica, 2 of San Domingo, 5 of Cuba, 1 of Spain, 4 of Japan, 3 of Porto Rico and 1 of Mexico.

These figures show that the Baldwin Locomotive Works are doing their share to prevent "race suicide" of the trades worked upon in their establishment. It will be seen that the plan is not altogether a philanthropic one, for the incorporation of the several features mentioned before make the system self-supporting. The chief advantage, however, is the development of a loyal, brainy set of men with a thorough training in the mechanic arts and especially developed in certain lines. The manufacturing plant that has a loyal, intelligent body of workmen who make their employers' interest their own has the very best equipment for meeting the strenuous competition of the present day.—*The Engineering Magazine for June.*

Aspinwall Potato Machines

Make Large Profits Easy by Economizing in Time, Labor and Money.

We make a strong, practical and automatic machine for every stage of Potato Culture; in fact, the Aspinwall is the only complete potato implement line in the world.

With Our Machines seed is quickly cut to best advantage. Planting, fertilizing and covering are accomplished at any depth and width of row desired. Spraying is effectively done for bugs and blight. Digging and sorting are made pleasant and agreeable work by our time and labor saving machines.

Our catalogue, illustrating and describing the various styles of

ASPINWALL POTATO

Planters, Cutters, Sprayers, Diggers and Sorters made by us, mailed postpaid.

Aspinwall Mfg. Co., Jackson, Mich., U. S. A.

F. R. PATCH MFG. CO.,

RUTLAND, VERMONT, U. S. A.

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing, Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering ap-

paratus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, so that prompt delivery can be made.

MERIT WINS!

Fourteen years ago the **CROSS OIL FILTER** was placed on the market. To-day it is the adopted oil filter of nine governments. It is used the globe over, and is the world's standard method of filtering and purifying lubricating oils. The Cross Oil Filter will **SAVE ONE-HALF THE COST OF OIL**. To

prove all we claim for the filter, we send it on thirty days' approval.

"The Cross Oil Filter will soon pay for itself and be a money-saver right along."

Harrisburg Foundry and Machine Works, Harrisburg, Pa.

The Burt Mfg. Co., 217 Main Street,
Akron, Ohio, U. S. A.
Largest Manufacturers of OIL FILTERS in the World.
Supplied also by Oil Companies, Engine Builders and Power Contractors.

BECKER-BRAINARD

Automatic Gear-Cutting Machines

CUT SPUR, BEVEL AND WORM GEARS.

Each size will cut a range of gears requiring two ordinary machines.

All working parts being simple and in plain sight, are easily adjusted.

If you wish to cut accurate gears at the least cost, write for further information.

BECKER-BRAINARD MILLING MACHINE CO., Hyde Park, Mass., U. S. A.

Popularity of American Talking Machines.

TALKING machines have found a big market among sailors and boatmen who by some American dealers are classed as their best customers. The manager of one of these establishments recently said:

"I don't know why it is, but our best customers are those who earn their living upon the waters. I have only recently filled an order for several talking machines for the United States Steamer Dolphin, prior to which time I supplied the Washington Navy Yard and five or six vessels of the United States Navy. In some cases the sailors have clubbed together and bought them, while in other cases the officers have invested in them.

"To-day the crew of every sailing vessel, from a big four-master to a Chesapeake Bay tug, is almost certain to have a talking machine, and I venture to say that six or seven out of every ten boats of the Chesapeake oyster fleet, on the Atlantic coast, are as well provided for. The vessels that come to Washington loaded with ice from the Kennebec River, away up near Canada, are also supplied.

"The best part of it all is that such instruments are a decided moral benefit to those on shipboard. The lives of sailors are lives of dreary solitude and hard work, and this is the reason why, as soon as they reach land, they make for some low dance hall, where there is a barrel organ, a cracked piano or an accordion grinding out music of a character more villainous even than the surroundings in which it is played.

"With a talking machine on board all this is changed. The ship may be in mid-Atlantic or in the solitudes of the South Pacific, thousands of miles distant from the home port, yet it makes no difference; as soon as the sailor's watch is finished and he has in a measure solaced himself with a hearty meal and a pipeful of plug or Trichinopoly, a few turns of the crank will transport him back to civilization."

It would seem as though the talking machine had thus in a measure solved the problem of entertainment in lonely places, for it is becoming as much in demand in the country as it is on the seas. Every well-to-do farmer, stockman or miner is certain sooner or later to obtain one. One encounters them through the Australian brush, among the adobe houses of Texas ranchmen and in the cabins of the Idaho and Montana sheep farmers and miners.

The talking machine is immensely popular among the non-English-speaking peoples of the earth. The Shah of Persia is delighted with it, and the Siamese Minister at Washington has several, in which he takes the greatest pleasure.

The Growing Use of Water and Electric Power.

WHILE it is admitted that steam is largely employed in America for the purpose of securing direct motive power, yet it is an undeniable fact that electricity is rapidly making inroads on the utility of this factor, and especially is this true with rented power, recent statistics showing that electric power is rented far in excess of any other kind. Possibly no other field has so aided the development of electric power as has the electric railroad, of which there are more than 1,200 in the United States alone, using a total capacity of more than 1,000,000 horse-power. There are said to be over 3,300 central stations for the distribution of electric current for lighting and power purposes, one company alone in New York City operating several stations, aggregating 250,000 horse-power, and the isolated plants in this city are reported to supply 100,000 horse-power.

Electric motors have been known for the last quarter of a century or more and at least twenty years ago were applied experimentally to the propulsion of boats and cars and to the operation of machinery, but as they depended for their supply of current upon primary batteries consuming zinc and costly chemicals, they could not make for themselves a place in the industrial world. The perfection of the dynamo and the discovery of the fact that the dynamo is reversible—that is, that if current were supplied to it, it would run as a motor, released electric power from the conditions that had previously hindered its development, and the art made an immense stride forward, particularly in this country. This development of the electric motor has been accompanied by a corresponding transmission, and especially is this true of the development that has been made since 1890, when there have been such remarkable changes in the methods of current generation as to enable the creation of new centers of manufacture around water powers and the transmission of power by electricity over distances that were previously thought prohibitive.

The development of electric power transmission at Niagara Falls, on the border line between the United States and Canada, has been the largest and most conspicuous of its kind, and from that point power is transmitted by the Niagara Falls Company to the city of Buffalo, twenty miles away, and other places, the ultimate capacity of the power houses being 50,000 horse-power each. In addition to the marvelous horse-power utilized and supplied by this company a large amount of the Niagara current is employed in electrochemical and electro-metallurgical operations, and in the extensive grain operations carried on at Buffalo, and at the Buffalo Dry Dock Company, where forty motors of upward of 500 horse-power capacity are employed in the process of building some of the largest steel steamships that ply the great inland lakes of the North American continent.

But it is to the far western portion of the United States that we must turn our attention to find the longest power transmission in the world up to the present time, that of San Francisco and several other Pacific coast cities, from the Sierras in eastern California, and over a distance nearly ten times that at

Niagara. Another wonderful feature of this work is that whereas the Niagara is a power secured from a fall of from 150 to 200 feet of a huge volume of water, the large enterprises in the State of California depend upon the utilization of relatively small bodies of water, but with falls varying from 500 to 1,500 and 1,800 feet. This application of power has relieved the strained conditions in many of the mines, owing to a scarcity of fuel, and a large amount of miscellaneous work throughout that State is now tributary to these long-distance transmissions, which excel in daring, in number and in commercial success anything attained in any other part of the world.

The transmission of the power of the North Yuba River, in the Sierras to San Francisco, above referred to, stretches across sixteen counties. The systems have two sources, one at Colgate, over 200 miles from the Golden Gate, and the other at Electra, 150 miles distant, meeting at San Francisco Bay, at Mission San José and at Oakland. The Colgate plant is located at the base of a 1,500-foot hill. Water is brought a distance of seven miles through a timber flume capable of delivering 23,000 cubic feet of water per minute. Current is generated at 2,400 volts pressure and is raised by transformers to a pressure of 40,000 and 60,000 volts, and as high as 80,000 volts have been reached. This current is carried across the Straits of Karquines in a span of 4,448 feet, supported 200 feet above the waters by steel latticed towers, the circuits being composed of stranded plow steel in order to obtain the requisite tensile strength. This power is employed in the operation of street cars, the running of flour mills, in the mines and various other industries.

"Water Curtain" a Perfect Theater Protection.

SOLID sheets of water rising from the footlights in theaters and stretching across the proscenium arch, forming a wall of water completely separating the stage from the auditorium—this may be the fire curtain of the future, according to *Popular Mechanics*. The "water curtain," which will doubtless be installed in all first-class playhouses of the future, is the invention of John W. Regan, late chief of the Boston (U. S. A.) fire department.

A pipe leads from a main in the street underneath the stage to the center of the proscenium arch. The nozzle is screwed on to it flush with the top of the stage floor. If there is not pressure enough from the street, which should be at least sixty pounds, it must be supplied from a tank from above.

This will give three sheets of water 150 feet wide and 60 feet high. Of course, there is the double action of the water going up and coming down. One of these curtains will protect the Boston Theater stage, which is the largest in the world. The water curtain will also lift the smoke so that the auditorium will be clear and the audience can walk right out.

The curtain of water is produced by a peculiarly shaped nozzle attached to a piece of pipe with an elbow extending upward. Across the nozzle are three slots, each about a quarter of an inch wide and extending from side to side. The top of the nozzle is not unlike a two-wick burner of a kerosene lamp. The nozzle, however, has three slots, and from them water radiates in three separate sheets, making a water curtain three layers thick, forming a barrier absolutely impervious to flame.

The water curtain was recently tested in the streets of Boston. The water flared out like a great fan, 50 feet high and 100 feet wide. Not only for theater curtains, but for the interior and exterior of buildings is the invention designed.

Interested in American Bridges.—United States Consul Norton, at Harput, Turkey in Asia, sends to the American Department of Commerce information to the effect that two projected bridges over the river Euphrates, a short distance from Harput, offer distinct opportunities for American bridgebuilders. He says: "The governor-general of this vilayet takes a keen interest in these projects and has asked me to secure plans and ultimately tenders from American firms."

For the Canadian Trade.—The Allis-Chalmers Company will hereafter conduct its Canadian business through a new organization called Allis-Chalmers-Bullock, Ltd., with Montreal as its headquarters. The organization includes the Bullock Electric Manufacturing Company, which was recently acquired by the Allis-Chalmers Company.

Automobiles and Agriculture.—The first farmers' organ to awaken to the utility of the automobile in agriculture is the *American Agriculturnist*, and an editorial in the last issue presented the case very intelligently. It advised farmers not to turn up their noses at the automobile because its possibilities exceed all dreams.

Dairy Machinery.—Our readers who are interested in this branch of industry will do well to send to the Vermont Farm Machine Company, Bellows Falls, Vt., U. S. A., for some interesting and instructive literature which the company has prepared concerning the operation of its specialties in dairy machines.

Time Vs. Cost.—Nails are so cheap in America and the workman's time is so valuable that it is unprofitable to straighten a bent nail or to stop work to pick up one when dropped.

Canada, the United States and the Empire.

GEORGE E. FOSTER, former Canadian Minister of Finance, contributes to a recent number of the New York *Dry Goods Economist* an instructive article on "The Canada of To-day," showing that the Dominion is not only taking enterprising advantage of the country's own possibilities, but that its future as a neighbor of the United States is practically assured. Herbert B. Ames, of Montreal, who is a prominent figure in the public business life of the Dominion, shares with others in an optimistic view of conditions.

"Canada, in my opinion," he said to an *Economist* representative, "is entering upon an era of great prosperity. A comparison of the trade figures of 1901-3 with those for 1895-7 shows that the imports for the three years 1901-3 are 86 per cent. greater than those for the three years 1895-7, before the preference to England was given. Canadian trade has expanded more than 100 per cent. during the last ten years, and the outlook in all directions is hopeful. The tariff question, however, demands attention. My opinion is that the Canadian customs tariff should be subjected to a thorough and immediate revision in the interests of the trade and commerce of the Dominion and the Empire."

Mr. Ames has just returned from England, where, with George E. Drummond, president of the Canadian Manufacturers' Association, and Mr. Hodgson, he was the guest of the London Chamber of Commerce. In an address before that body, Mr. Ames made some interesting references to the trade of Canada. He pointed out that before the preference was granted to British imports British trade with Canada was declining and was threatened, in fact, with almost complete annihilation. In 1872, 58 per cent. of Canadian imports came from Great Britain; in 1882 the amount had declined to 45 per cent.; in 1892, to 35 per cent., and in 1902 it barely reached 25 per cent. Since the preference, British trade with Canada had largely increased in value, but it had not more than held its own in proportion to growth of the total imports.

The chief commercial rivals of Great Britain in Canada, Mr. Ames further pointed out, were the United States and Germany. The latter has been placed practically *hors de combat* by the surtax which German goods now have to pay. The effect will probably be, he said, to reduce German imports by one-half or one-third of their former amount.

The Americans are enterprising business men, Mr. Ames told the Britishers, and he proceeded to tell them what were the advantages offered by their most formidable competitors in Canada. In the first place, he showed that the manufacturers in the United States usually made their goods in advance of selling them, and so were prepared to execute orders at the shortest possible notice. That was too seldom the case in Great Britain, and considerable delay often occurred in the despatch of goods from that country owing to their having to be manufactured after receipt of the order. The Americans, too, quoted their goods delivered in Montreal, and in the currency of the country; consequently a Canadian importer could tell just what they would cost laid down in his warehouse. On the other hand, when buying in Great Britain, he had to do so at their cost in the warehouse there and add on to that an infinite number of small charges.

The American methods of securing business, too, showed far greater activity than those of the British, declared Mr. Ames. The Americans took a greater share of the expense than did English manufacturers in pushing the sale of their articles, and they also recognized that Canadians had trading idiosyncrasies, and tried to meet them. The British manufacturers, Mr. Ames pointed out, would have to study the requirements of the Canadian market and learn to produce goods which the people in Canada wanted, rather than what was deemed best in Great Britain.

The *Economist* interviewed other eminent Canadians and the trend of their opinion was more than favorable to the future of the industries of the North American continent.

American Trade with the Dominion.

IMPORTS from the United States into the Dominion of Canada, says United States Consul Wakefield, of Orillia, Ontario, in a recent report, show a substantial increase each year, and this in the face of the fact that a new subport of entry was established last year at North Bay, at which entries are now made for a section formerly comprising part of the territory connected with the port of Orillia. Imports for the year ending June 30, 1903, amounted to \$1,770,000. By far the greater part of these imports are free goods. The duties collected amounted to \$42,000, as against \$39,000 the previous year. He says:

"Two lines of men's boots and one of ladies' made by American firms are handled here, and the trade is increasing steadily.

"American harvesting machinery and agricultural implements give splendid satisfaction. Three or four of the largest American agricultural-implement manufacturers have established branch plants in Canada.

"Collars, cuffs and shirts from New York, imported last year for the first time, have given excellent satisfaction.

"In the machinery line very little is imported except from the United States. From 30 to 50 per cent. of the tools and machinery used in this district is imported from the United States. Nearly all of the most expensive machinery used in the tanneries, pulp mills and wood-specialty and veneer works are of American manufacture.

"With the same conditions that now prevail, and careful consideration of the local requirements, there is little danger of any falling off in the imports

from the United States, excepting only in those articles which are being manufactured in Canada by branches of American firms. The present outlook is as favorable as that of the past two or three years, and the past rates of imports should readily be maintained."

Among the American products enumerated by Consul Wakefield as being imported into the Orillia district are cash registers, cash carriers, cottons, canes, umbrellas, brushes of all kinds, collar buttons, fancy goods, etc.

Facts About a New American Wonder-Worker.

IN the June *World's Work* Arthur Goodrich tells some interesting stories about Charles P. Steinmetz, one of the greatest electrical inventors, some of whose achievements have heretofore been mentioned in THE AMERICAN EXPORTER. He is considered by many to be the Edison of the future. Steinmetz has a mathematical brain. One of his ablest assistants spent a number of days of hard work in solving an intricate mathematical problem. When he had finished it, he asked Steinmetz to work it out. The inventor grasped the problem at once, counted on his fingers a few times, and gave the correct answer without touching pencil or paper. Yet he remarked recently: "Mathematics are valuable only to obtain results. Mathematics for mathematics' sake are foolishness."

Some years ago Steinmetz went into the Adirondack mountains with a hunting party of friends. Not caring to hunt, he was often left alone at a little lodge that was made the party's headquarters. One night before the camp-fire a mathematical question came into his head. To settle it, he needed a table of logarithms which could not have been found within miles of the camp. He remembered a few figures, and in a short time had worked out an entire table of logarithms for himself, and from it solved the problem. This mathematical sense, which was originally trained by hard study at college, makes it possible for him to answer quickly the rapid fire of questions his aids hurl at him daily.

The laboratory workers come to him constantly for advice and direction. Eighteen thousand employees stand ready to work out his ideas. With the men, he is always genial and democratic. When any business matter needs settling, he does it in determined fashion. He is as independent as he is good-natured. When the heads of the works made a rule against smoking in the factory, Mr. Steinmetz said he would smoke or leave. He did not leave. "He can accomplish more in an hour," said one of his assistants, "than I can do in a week." If some difficult problem needs solution at the works, it is nearly always taken to Steinmetz.

Not long ago there was an explosion in a manhole in New York City, which made great trouble for an electric railroad. Many local engineers tried to find the cause of the trouble, and gave various unsatisfactory explanations. The matter was brought to Mr. Steinmetz's attention. In a few moments he asked how certain adjacent wires in the manhole were covered. Here, indeed, was the trouble. It was simple, but no one else had thought of it. He takes the short cut to the essential thing. It is characteristic of all his work.

Buys a Railroad to Demonstrate a Principle.

WESTINGHOUSE, the American inventor, through one of his companies, has bought control of a railroad for the purpose of demonstrating the feasibility of conducting broader passenger and freight traffic by electricity. The railroad acquired is the Lackawanna and Wyoming Valley Rapid Transit. It was built for a third-rail electric line between Scranton and Wilkes-Barre, Pa., and between Scranton and Carbondale, Pa. George Westinghouse was identified with the syndicate which advanced the money for the construction of the Scranton-Wilkes-Barre line, which has just been completed. The Westinghouse company has advanced \$4,000,000 for control of the traction company. Of this amount \$2,000,000 was taken from the company's treasury, and \$2,000,000 was borrowed at 6 per cent. on notes purchased by a New York firm.

It is stated on semi-official authority that if the Westinghouse demonstration is a success, the road will be turned over to the Pennsylvania Railroad, one of the largest trunk lines in the United States. It is this sort of faith in new ideas that causes American industries to make rapid progress.

Agricultural Exposition in Russia.—According to *Les Annales Diplomatiques et Consulaires*, Paris, an agricultural exposition is to be held in Kief, Russia, during August and September, 1904. It is to have an industrial department or division for the exhibition of machines for refineries, distilleries, breweries, soap factories, brick kilns, starch factories, factories for making farinaceous foods, and another division for industries that aid agriculture; rope walks, tanneries, factories for extracting vegetable and mineral oils, glue and paste mills, etc. Agricultural machines, seeds, and everything pertaining to agriculture will be admitted free. The exposition is under the direction of the Agricultural Society of Kief.

Chili Wants American Railroads.—The Chilean Government expects to spend \$100,000,000 within the next fifteen years on railroad and other improvements, including sewerage and paving, harbor improvements, etc. A special commissioner of the Government is now in the United States preparatory to asking for bids for the initial work on the Trans-Andine Railroad, a matter of \$250,000. It has practically been decided that the equipment used will be made in the United States.

CARY'S UNIVERSAL BOX STRAPPING

Made of soft steel through which nails can be easily driven.

Put up in coils of 300 feet and packed 20 coils in a case.

Patented
in All
Countries.

Made in four widths, viz.:
 $\frac{1}{2}$, $\frac{3}{8}$, $\frac{3}{4}$ and 1 inch.

PAT. MARCH 12 AND SEPT. 24, 1895.
CARY'S SKELETON BUNG AND BOX FASTENER.

SKELETON AND TWISTED PRONG FASTENERS.

MADE IN VARIOUS SIZES.

CARY'S TWISTED PRONG
FASTENER
PATENTED SEPT. 24, 1895.

TELEGRAPHIC PROGRESS.

Sixtieth Anniversary of Invention Sees New System Simplifying Present Methods.

MAY 24th was the sixtieth anniversary of the initial operation of the American telegraph. To be exact, it was on May 24, 1844, that the first message was sent over the line constructed under Morse's direction between New York and Baltimore. The development from the comparatively simple and primitive methods of that time to the complex and perfected operations of the present time is a chapter in progress and invention, beside which the highly colored fairy romances of the nursery are tame, indeed, says the *New York Times*. Samuel F. B. Morse, brilliant as was his mind, daring as were his conjectures, could scarcely have conceived in even his most sanguine moments that the little seed of his sowing would in time bear fruit of such vast magnitude that his own victory in science, great as it undoubtedly was, would seem only a milestone in a vista of progress reaching all around the globe.

When civilized nations had about ceased to wonder at the marvel of the telegraph there came again the reminder of the human mind's limitless ambitions, and to add to the wonders of the world a new factor in rapid transmission was developed in the invention of the wireless system of telegraphy, the tremendous possibilities of which are only beginning to be realized. That the wireless has gone far beyond a mere experimental stage has been unequivocally demonstrated during the present war, when reports of events of the utmost importance are daily transmitted from the scene of conflict by means of this potent factor in the world's news-gathering service and published to the world in the *New York Times* in common with the *London Times*.

There is still another phase of telegraphy of which the public has as yet heard practically nothing, but which it seems has already reached a stage that promises remarkable results. J. C. Barclay, the assistant general manager of the Western Union, announced last month that the company is about to introduce a novel system by means of which any one capable of operating an ordinary typewriter will be able to transmit a message, which will be received in facsimile on a typewriter at a distant station.

"This is my own invention," said Mr. Barclay, "and it is practically completed. The message consists simply of the transmission of a positive and negative current, which forms a system of characters; each character sets the receiving instrument in a position to convey these characters to a receiving magnet. It will be possible in time for a newspaper correspondent in Chicago to transmit his matter directly to a machine prepared to receive it in New York, over 800 miles away. It will also be possible by means of this invention to apply the same principle to the linotype machine in newspaper composing rooms, so that as the correspondent sends in his messages they will be set up ready for the stereotypers. I have been working on this for over a year, and I am now in a position to say positively that it is in successful working shape.

"This anniversary of the installation of the Morse system," continued Mr. Barclay, "sees the telegraph system reduced to a science such as was hardly dreamed of in the olden days. At the time that Morse invented the telegraph, and for many years afterward, everything was done by guess. To-day the large number of electrical engineers can figure out what is required to operate our lines with as much exactness and ease as the civil engineers can calculate the equipment required in their efforts.

"The wireless system has already been developed to a point where its value in communicating off shore, between vessels, and between the mainland and islands near shore, is beyond cavil. I believe there is a great future for that system where it is not possible to use wires. Of course, it has not been demonstrated that the wireless can be worked for any considerable distance on land. That does not seem possible. We have now between here and the city of Philadelphia nearly 1,000 wires in operation. To replace them with the wireless would require an equal number of wireless transmitters. And so far it has been impossible to inaugurate two systems that would not interfere with each other. Whether that will ever be possible remains to be demonstrated.

"Perhaps no better exhibit of the marvelous development of the telegraph is to be found than in the records of the Western Union Telegraph Company's growth. In 1866 the company operated 37,380 miles of poles and cables and 75,686 miles of wire. It had 2,250 offices. In 1903 the record is 196,517 miles of poles and cables, 1,089,212 miles of wire and 23,120 offices.

"In 1866 it handled between 4,000,000 and 5,000,000 messages; in 1903, 69,790,866 messages, not including those sent over leased wires, railroad lines or leased press circuits. In 1866 the average toll per message to the public was \$1.047, and in 1903 it was \$0.314.

"When Morse invented the telegraph he invented the best system that had been introduced up to the present time. But he had no idea that the young American had such a quick ear for music that it would enable him to discard the old record register and take the messages by ear. I do not think that at the present time there is in use a single one of the registers for reading messages. Everything to-day is done by sound.

"The quadruplex invented by Edison makes it possible to transmit four messages simultaneously over one wire. We have also an important auxiliary in the Wheatstone system, which enables us to send a message over a line 500 miles long at a rate of 400 words a minute."

Starch Machinery for Mexico.—Some \$65,000 worth of American machinery will be installed in a new starch factory to be constructed at Aguas Calientes, Mexico.

Telephone Exchange Suspended in the Air.

ONE of the marvels of modern American methods in constructing buildings recently attracted attention in New York. A brick and iron building swinging in midair is the sight that was seen. While literally the structure was swinging from two tripod arrangements, the statement might be misleading to some who might be led to believe that they could expect to see it swaying to and fro in midair. This was the means taken to shore up the building during the process of making some additions to the Madison Square Exchange of the New York Telephone Company. The *Engineering News* gives full facts about the operation, from which some extracts are here made.

Perhaps no kind of business or building would be encountered by a contractor that would present more difficulties than those met with in a telephone building. The numerous wires entering the cellar of a central station, their running up to the several stories, their distribution close to walls and under the floors to scores of operators, the need of protection from noise, dirt, rain and the usual concomitants of building operations, make an alteration in a telephone central station one of rare difficulty.

The process adopted was much more expensive than the usual method, but was adopted as the only practical way of complying with the somewhat exacting conditions. The members of the firm which did the work and with which the idea is an entirely original one, submitted the plans to a number of architects, builders and persons engaged in similar work, and none would give it a hearty indorsement. All, however, regarded it with intense interest and watched the progress of the work from start to finish. It was a perfect success in every way. There was not the slightest interruption of the work of the exchange and not the least indication of a split or crack in the walls of the building.

400,000 Italians Are Becoming American Citizens.

SOME interesting facts about the progress which Italians are making in New York City have just been made public. There are nearly 400,000 Italians in New York. Fifty thousand of them are boys and girls in the public schools. There are 115 doctors, 63 druggists, 21 lawyers, 15 school teachers, 9 architects and 7 mechanical engineers.

Nearly all of the Italians in America come from three provinces in Italy. At home they were farm laborers, earning from 39 to 40 cents a day and living in little stone cabins. Some of the immigrants had small farms of their own, but the land is poor and the Italians have nothing to work it with except spades. Their life was a hand-to-mouth struggle against starvation and debt.

Since the Italians have come to New York they have acquired \$60,000,000 worth of property in the city. This is an average of \$160 apiece, or \$800 a family. They own \$20,000,000 worth of real estate. They have \$15,000,000 in the savings banks. They own 10,000 stores worth about \$7,000,000. And they have about \$7,500,000 invested in the wholesale business besides.

The Italians come here to stay, not to make money and go home. "Four or five years of America seems to unfit the Italians for living in their native country," says Adolfo Rossi, the Italian Commissioner of Immigration. They have presented three monuments to the city. One of them, the statue of Columbus, is a valuable work of art. They are now raising money to build a school of music in honor of Verdi. These are the sort of facts that all Americans should be proud of. Our national greatness rests upon such records as this one that has been made by the Italians."

Chinese Experts Studying American Methods.

MANDARINS V. K. Lee, Tsu King Yuan and Tse Shao Yung, three commissioners of the Chinese Government, are now in America. They are mandarins of the first-class and have been sent out to investigate the steel plants of America and England.

"China intends constructing a plant of her own for the manufacture of armor plate and steel rails," said Mr. Lee recently. "She already possesses a steel plant near Shanghai, but it is of an old pattern and not at all up to date. The new plant will be located in the interior somewhere, exactly where has not been decided. But we want the most improved machinery, the newest models, in order to turn out steel in quantity and of the best quality. Our party will stay four days in Chicago, and we will investigate the Illinois Steel Works. We shall be gone three months or more, and on our return to China will make a report to the Imperial Government."

Mr. Lee would not say how large a sum China is prepared to put into the establishment of the plant, but he intimated that the amount would be enormous, and that no pains would be spared. The Chinese visitors were greatly impressed with what they saw of American machinery and methods.

Our Trade with France.—United States Consul B. H. Ridgely, at Nantes, corrects some erroneous impressions regarding American trade with his district. As there is no direct line of boats most of our exports to his district are entered through other ports. He says: "For example, the statistics would make it appear that almost none of the canned meat imported at Nantes comes from the United States, but that virtually all of it is imported from England. The fact is that nearly all this canned meat is of American origin, but it reaches France via Liverpool. This observation, indeed, may be generally applied to all American products sold in this region, only a very small percentage being imported directly from the United States."

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 1/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawed oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

OF EVERY DESCRIPTION.

SOLE BUILDERS OF

GATES ROCK AND ORE BREAKERS.

Pumping, Blowing and Hoisting Engines,
Air Compressors.

REYNOLDS CORLISS ENGINES FOR ALL POWER PURPOSES.

REYNOLDS CORLISS ENGINES
for All Power Purposes.

GATES ROCK AND ORE
BREAKER.

No. 2 SURFACE PLANING MACHINE. Requires very little power, and is designed for general work. Works all kinds of wood with facility. Write for cuts fully showing its advantages.

WOOD-WORKING MACHINES for Export.

SINGLE MACHINES OR COMPLETE EQUIPMENTS.

SMALLEST TOOLS TO LARGEST SIZES MADE.

The wood worker interested in knowing just what progress has been made in wood-working machines is invited to write us for particulars of some of the new ones we have just built. We will send him some information that will interest and surprise him. New catalogue free. Send for Sander book and pamphlet on care of Band Saws. We correspond in Spanish.

No. 2 PLANNER, MATCHER AND MOLDER. Fine machine of medium capacity for planing, matching and molding. Send for descriptive circulars; sent on demand.

J. A. FAY & EGAN CO., 164-184 W. Front St., Cincinnati, Ohio, U. S. A.

Story of the Panama Canal's \$40,000,000 Check.

HERE is the simple story of how Uncle Sam took \$40,000,000 out of the United States Sub-Treasury in New York City, to pay the French for their Panama Canal stock, without disturbing the financial situation in New York much more than if somebody had bought a bag of peanuts from a sidewalk vender. Forty million dollars is a large sum of money in Wall street or anywhere else. If it had all been taken out of the Sub-Treasury at once, in gold, or silver, or even in greenbacks, it would have left a void, the bare sight of which would have given every banker in town a chill.

Such a rude and barbarous proceeding was not to be thought of in these days of high finance. So, instead of real money, recourse was had to those neat little slips of water-marked paper called checks. First of all the Secretary of the United States Treasury inscribed his name on a large number of checks, by which he gradually withdrew from many small banks scattered over the country several million dollars, which he concentrated in several large banks in New York, known as general depositories of Government money. Then the Secretary of the Treasury signed another series of checks, for larger amounts, by which he withdrew \$27,000,000 from the big New York banks, and put it to Uncle Sam's credit in the Sub-Treasury.

All was now ready for the \$40,000,000 transaction. Last month the Secretary of the Treasury signed a check or treasury warrant for that amount, jumped on a fast train, and brought it to New York in his inside pocket. He passed the warrant over to J. P. Morgan & Co., which firm had been appointed to disburse the check to the French owners of the Panama Canal stock. Next, J. P. Morgan & Co. turned their \$40,000,000 over to Sub-Treasurer Fish for collection. Then, instead of drawing one check for the whole \$40,000,000, the Sub-Treasury split up the amount in smaller checks, aggregating that sum. J. P. Morgan & Co. deposited \$25,000,000 of their Sub-Treasury checks in various big banks in this city, and kept \$15,000,000. With this latter sum the firm could have bought gold, either from the Sub-Treasury or from the banks, for direct transmission to France. They did not immediately buy gold so far as known.

Actually no gold or greenbacks figured in the transactions. All of the checks drawn passed through the Clearing House. The banks got \$25,000,000 in Sub-Treasury checks from J. P. Morgan & Co., and paid \$27,000,000 in Treasury checks to the Sub-Treasury. Their deposits were thus reduced only \$2,000,000.

How much of the \$40,000,000 will ultimately reach France, in the shape of American gold, can only be conjectured. Ten millions in gold has already been shipped, most of it, presumably, on account of the Panama warrants. The New York banks had \$22,000,000 in gold on the day the \$40,000,000 warrant was drawn in excess of their regular gold reserve of 25 per cent. The French may buy American goods or securities with a large part of their \$40,000,000, in which case the money will stay here.

Planning for a 75-Miles-an-Hour Train.

FAST electric trains that will make seventy-five miles an hour are being planned by the New York Central Railroad in connection with its improvements in New York City, which have heretofore been referred to in THE AMERICAN EXPORTER. About \$20,000,000 will be spent for electrical equipment.

Chief Engineer Wilgus, of the New York Central, made the statement last month that the system not only will use electricity in its tunnel, but will extend the electric zone to points further away. He said that when the railroad yards are enlarged (upon which work is now being pushed) they will take in fifty-seven tracks and will cover a large area, affording an entirely new distribution of the traffic inward and outward.

The new Grand Central Station in New York City in its main portico will be devoted to through-train traffic, with twenty tracks. Under this main station will be the suburban system, with from eight to twelve tracks. The electrification, said Mr. Wilgus, means extending the electric system from twenty-five to fifty-five miles from the Grand Central Station. The suburban trains will be handled by the multiple unit system, under which every car or two out of three cars will be equipped with electrical motors. Each car is therefore practically self-propelling, so that a single car can be started or fifteen in a train.

For the through trains it has been decided to use electric locomotives, which will be handled with 2,250-horse-power engines. The suburban trains will be capable of a speed of seventy-five miles an hour, and it is the intention of the company to eliminate small grade crossings.

American Tools in Japan.—Charles A. Francis, formerly of Hartford, U. S. A., and who is now in Tokio, Japan, writes that "at the present time the various agencies handling American tools cannot get them here fast enough, and that this year is the best known in the sale of American machinery." He also thinks the American machine builders should make a great effort to increase the trade in Japan for American tools. Mr. Francis was invited to a dinner given by eight members of the Shibaura Engineering Works, recently, at a Japanese hotel—"The Mihorashi." The hosts were all former students of the Tokio Koto Kogo Gakko, in which school Mr. Francis is an instructor. A very pleasant evening was spent, and with the help of an interpreter Mr. Francis was able to give quite a long and interesting talk on the methods of handling American tools, as well as suggesting some of the various ways in which these tools could be used to better advantage in turning out work.

American Machinery in Russian Ports.

CIVIL and mechanical engineers who reside in this country and who were retained on the work of creating the defenses of Vladivostok and Port Arthur state that not less than \$3,000,000 worth of American-made machinery is installed in those beleaguered places. The entire system of supplying Vladivostok with water was planned by Charles D. Pierce, M. E., manager of the Pierce Well Engineering and Supply Company, of New York, at whose works the machinery was made. The system for applying compressed air to military and naval engines at Russia's ports is wholly the work of William L. Sanders, M. E., formerly Mayor of North Plainfield, U. S. A. Mr. Saunders has spent much time in Russia and gave his personal attention to designing special apparatus for Vladivostok and Port Arthur which was made in this country. The Russian system for operating torpedoes is largely taken from the methods originated by John P. Holland, M. E., of this country, inventor of the Holland submarine torpedo boat, several of which are being made at Port Arthur. In the electric light and power installations used by Russia's army and naval forces in Asia there is an immense quantity of apparatus that was made in this country.

The armor of the Russian warship, the Variag, was made in strict conformity with the formula for the Harvey process supercarbonated armor, invented and made in the United States, and which caused the revolution of armor-making in all countries having an efficient navy. Russia has a consulting mechanical engineer who was long on the staff of Thomas A. Edison, the American inventor, and who keeps the general staff of Russia well informed about every invention made in this country which seems to be of value for military and naval purposes.

Russia's purchases of American-made scientific apparatus applied to military purposes began about sixty years ago, when Count de Nesselrode was requested by the Czar to investigate the conflicting claims of inventors with relation to the electric telegraph. The matter was turned over by de Nesselrode to Col. George W. Whistler, U. S. A., retired, sometime engineer of the Delaware and Raritan Canal Company, and father of the late James McNeal Whistler, the artist. Colonel Whistler at the time he made the inquiry into the invention of the electric telegraph had just designed and built the first railroad in Russia from Moscow to St. Petersburg.

Japan and Russia at American World's Fair.

BOTH Russia and Japan have exhibits at the American World's Fair in St. Louis. Russia started late and her display will be described in a later issue of THE AMERICAN EXPORTER. Japan's exhibit is the surprise and admiration of all countries, and in some respects is the most marvelous ever shown by any nation. To the public it is a revelation; to all observers it is conclusive evidence of the enterprise, industry and skill of the Japanese people. Everywhere in the Japanese exhibits—for there are more than 80,000 separate exhibits—thoroughness is noticeable. Nothing is left undone, but care is given to every detail, and there is a thoroughness that accounts for Japan's progress and success in peace and in war. This plucky little empire expended \$1,000,000 for World's Fair participation.

Japan's exhibits occupy space in the different buildings. She asked for more space than any two other foreign governments and secured an allotment nearly equal to her demand. Every one of her exhibit booths is beautifully decorated with inlaid natural woods and gold and lacquer, but the most picturesque part of Japan's representation is found along the terraced hillside covered by the buildings and gardens of the Imperial Government and on the gay and festive "Pike," where her quaint customs and interesting ways are enacted by hundreds of living Japanese types, the fascinating and graceful geisha girls being most noticeable. It is not Japan's gay life that is attracting world-wide attention, but the busy, active, industrial life of that wonderful country which in so short a time has risen to a position of prominence among the great nations of the world.

\$1,000,000 of Canned Salmon in a Month.

EFFECTS of the war in the Far East on the Pacific Coast trade of the United States were outlined a few days ago by Charles T. Takaboshi, who lives at Seattle, Wash. "The withdrawal," said he, "of the six Japanese liners that have plied between Seattle and Oriental ports for the last eight years, that they might be used in the transport service during the war, had a temporary depressing effect on some branches of activity in Seattle, but business is good again. The Boston line, on which greater demands have been made, is now dispatching an additional number of vessels, and important shipments of foodstuffs are going out not only from Seattle, but from Vancouver, Tacoma and Portland. Probably \$1,000,000 worth of salmon went from Seattle to the Orient last month. The flour shipments from Seattle have been steadily increasing each year. Last year they aggregated about 70,000 barrels, and owing to the larger demand incident to the war it is my belief that the shipments this year will reach 100,000 barrels."

American Machine to Split Wood.—A Spokane (U. S. A.) man has invented a machine capable of splitting wood 2 feet long and 18 inches thick. The machine is run by a three-horse-power gasoline engine, and consists of a huge knife working through the knottiest wood at the rate of sixty strokes per minute. A contrivance to carry off the wood is to be added to the machine.—*American Woodworker.*

LITTLE'S WONDERFUL COBWEB CARBON PAPERS.

This product is unique in Carbon papers; its discovery an accident; its success immediate. For a long time after its first advent, the tissue paper upon which the carbon is made could not be procured. The mill declared it impossible to duplicate the shipment. The lot previously made was an accident. They had exhausted every facility of their plant to fill the order, with no avail. It looked as though the Cobweb was forever lost. Urged by Mr. Little, continuous experiment was made and finally the net result of a former accident was secured and the stenographic profession permanently enriched by the only carbon paper made that would produce from sixteen to thirty clean, clear-cut impressions at one writing. All machine company's tests for "largest number of copies" use Little's Cobweb Carbon Paper. It is very thin, extremely fervent, does not smut and will not deteriorate, under any ordinary circumstances, in any climate. *Age improves it.* Used and recommended for taking six to sixteen duplicate copies. Made in the usual colors.

Send for Catalogue. Orders received through New York commission houses at export rates.

MONROE PORCELAIN REFRIGERATORS.

THE MONROE IS A HIGH-GRADE REFRIGERATOR, BUILT FOR THE HOUSEHOLD.

Each food compartment is moulded in one solid piece of porcelain. The corners are rounded. There are no joints or crevices for the food to decay in. The porcelain is white, durable, and as easily cleaned as a china dish. The ideal house refrigerator, absolutely sanitary. The prices here quoted for foreign markets only (U. S. gold or its equivalent) include crating, ready for transportation abroad, delivered f. o. b. at New York City.

MONROE No. 21, Style D, Solid Porcelain Inside, \$54.00
Oak Exterior,

Crated, measures 49 x 27 x 47 inches. Gross weight, 630 lbs.

MONROE No. 30, Style E, Solid Porcelain Inside, \$69.00
Oak Exterior,

Crated, measures 49 x 27 x 57 inches. Gross weight, 820 lbs.

All sizes carried in stock ready for immediate shipment.
Special sizes built to order.

Our latest catalogue, illustrating and describing the various styles of Solid Porcelain Refrigerators made by us, mailed postpaid.

Orders received direct or through export commission houses. When ordering through the latter, to prevent errors, kindly mail us a duplicate of order.

Two-Cent Postage, America to Europe, Perhaps.

OUR readers in various quarters of the world will be interested in the outcome of the session of the Universal Postal Congress, which will soon be held in Rome. The congress will comprise the most cosmopolitan body of distinguished representatives of Governments that ever met in the Italian capital. Every civilized nation is directly interested in its deliberations, and the congress is likely to be one of the most important in the history of the Universal Postal Union. The United States Congress has appropriated \$7,500 to defray the expenses of the United States delegate, Eugene F. Loud, of California, and efforts are being made by the United States to have the cooperation of other governments in a number of radical experiments in postal service, so that the results may be available as a working basis for the consideration of these propositions at Rome.

Two-cent postage with countries like Great Britain and France, universal postage stamps and a tariff schedule for mails in transit in countries other than those in which they originate, or for which they are destined, are some of the subjects which are being discussed among postal officials.

Another important feature will be the inclusion of China in the union. The Celestial Empire is now the only important Government in the world which does not belong to the vast postal federation. She has already given notice of her intention to join, but war troubles delayed the organization of a modern system there. There are sixty-five countries in the union.

Postmaster-General Payne is strongly in favor of the application of 2-cent postage to foreign letters passing to and from France, Great Britain, Germany and countries similarly situated, where there is direct and quick transit. He has talked this over with the British Embassy officials, and representations on the subject have been made to Great Britain with a view to action in the near future. This would put these countries in the same postal relations with this country as Canada and Mexico. Facilitation of international correspondence is to be sought by adopting a universal postage stamp.

Several countries have also addressed communications to the American Government suggesting different forms of prepaid reply missives. Notable among these are France and the Netherlands. Several objections have been raised to reply missives which depend for their prepaid postage on the use of a stamp printed and sold in another country. Every country is disposed to jealously guard its right to receive cash in advance for the service it undertakes to perform in mailing a letter.

Second Assistant Postmaster-General Shallenberger has devised a plan which requires that every letter shall have upon it the stamp of the country in which it is mailed and which may be conveniently paid for in the country which has invited the reply. Each country, according to this plan, is to prepare and sell special government international reply postage envelopes at 10 cents each, having one five-cent stamp or its equivalent embossed on the right hand corner, to be canceled when mailed, and a similar stamp on the left of the envelope to remain uncanceled.

The first stamp is to pay outward passage, half ounce weight. The second stamp is to render the envelope, when relieved of its enclosure, good for the purchase of a reply stamp of like value at any post-office in the country of destination. Postmasters are to be instructed to take credit for these envelopes in their stamp account and to forward them to the central office to be redeemed for cash by the country of origin in accounts between the two countries. Postage stamps the world over are at present good only in the country of issue. The difference in the monetary values of the various countries is one of the main objections to the scheme.

The congress undoubtedly will dispose of the vexed question of transit rates for mail crossing intermediate foreign domain, a vital problem which has confronted every convention since the inception of the postal union, and has been as often undisposed of. The effort at Rome will be to reduce these rates materially and to make one fixed rate, instead of a gradual decrease in rates as at present. This Government is in favor of this plan and also of making the transit rates on letters and on printed matter identical.

A graduated reduction was arranged at the last postal congress, held in Washington in 1897. Every grain of weight so carried across another's country is scrupulously paid on the basis of statistics taken once in three years. Some countries seek the total abolition of these rates and the substitution of an arrangement by which each country carries the mails of all others free.

The United States is on record for this reciprocal arrangement, and its delegates to the Vienna congress in 1891 carried specific instructions to vote for such a plan. It was smothered, however, in committee, as a concession to secure the adhesion of the Australasian colonies to the union. Germany also has advocated a plan of taking the average figures for each country in the last two or three statistic periods as a permanent basis.

One Secret of American Success.—*Power and Transmission* says the secret of the cheapest of American manufactures is claimed to be, partially at least, in the interchangeability of parts of every mechanism, in the standardizing of constructions. A mechanical invention in this age is not complete till the tools to make it in interchangeable parts have been invented.

Largest Steel Oil Barge.—The biggest oil-carrying steel barge in the world, Standard Oil No. 94, recently built at Shooter Island, U. S. A., arrived recently in New York on her first trip from Port Arthur, Tex., with 50,000 barrels of oil, the largest cargo of the kind that has ever been carried in one bottom.

Gain in Exports of Wire, Wire Nails and Pipe.

RETURNS for April show that very nearly 10,000 tons of wire, wire nails and pipe were exported through New York and other Eastern seaboard points last month by the United States Steel Corporation. Shipments in March aggregated only about 7,500 tons.

The exports of wire amounted to 4,172 tons, as against 3,748 tons for March. The chief April consignments went to Australia, five shipments amounting in all to 1,338 tons going to that part of the world. To South Africa 1,320 tons were shipped, the Argentine Republic having been shipped 796 tons. To Brazil was sent 458 tons, while the balance went to Chili. To Europe 981 tons were shipped, 594 tons of which went to ports in the United Kingdom. To the Continent 387 tons were forwarded. Two hundred and fifty tons went to South Africa. Cuba received 183 tons. Shipments also went to Mexico, Malta, China and Japan.

The pipe exports aggregated close on to 4,000 tons, being an increase of 100 per cent., compared with the exports during March. In April Europe was the largest buyer, especially the Continent, to which 2,737 tons were forwarded.

Over 1,600 tons of wire nails were sent to various foreign countries in April, chiefly to Europe. About 900 tons went to Europe, 759 tons going to the United Kingdom and 152 tons to the Continent. Two hundred and fifty-eight tons went to Australia. Two hundred and thirty-two tons were shipped to South America, Chili receiving 205 tons, while the balance went to the Argentine Republic. To China and Japan were sent 116 tons. Smaller lots went to Malta, South Africa and Cuba.

Our Shoe Machinery, as Well as Shoes, in Demand.

SHOE exports have made rapid gains, and the future of this branch of the American trade abroad seems to be assured, although foreign manufacturers are awakening to the fact that the American product is a vigorous rival to their own output. At the outset the foreign manufacturers laughed at the idea of our manufacturers securing a foothold in their markets to an extent that would affect them, but now they realize that American footwear has gone forth not only to capture the foreign markets, but to hold them afterward. The great selling card of American footwear has been style, finish and durability. To secure a strong foothold in any foreign country our manufacturers have had to study the conditions ruling in the section that they were after. This has been done to some extent, but the time has now arrived when even closer attention will be paid to this end of the business.

Foreign manufacturers now know why our footwear has met with favor in their home markets, and are trying to overcome this popularity by producing a similar shoe. They have come to this country and bought the latest improved machinery. They have examined into our methods, bought our leather, studied our styles, and have even gone so far as to engage skilled workmen to go back with them to teach the native help the way that shoe manufacturing is carried on here. This is paying our manufacturers a very high compliment.

American Currency in Canada.

A SPECIAL telegram to the *Halifax Chronicle* from St. Johns, New Brunswick, states that the Clearing-House directors have decided to accept American currency at face value in all the city banks. Heretofore one-fourth of 1 per cent. discount has been charged. A Canadian bank manager, speaking of the new rule, said that the reason was that American money was supplanting Canadian currency and limiting the circulation of Canadian notes. A great deal comes across the American border and finds its way into St. Johns. As a discount was charged at the banks, merchants used the American money to pay their help and thus its circulation was aided. Now the banks propose to accept it at face value and will promptly ship it to the United States. Thus are the two great transcontinental countries of North America placed one step nearer the fulfilment of the dream of the late Erastus Wiman.

Formosans Studying Our Methods.—S. Nimoso and K. Endo, engineers of the Formosan Railways, are in the United States on a tour of observation. They are reported to be greatly pleased with American methods and have highly praised the plants which they have inspected. Mr. Endo said recently "It is really wonderful the way your factories produce such excellent goods. Your machinery seems to be close to perfection and your workmen are extraordinarily diligent and attentive. They all take an interest in their work and do not apparently have to be watched. I shall no longer wonder how Americans are able to do what have sometimes seemed to be miracles in the line of manufacture."

London's New Tubes.—Some of our British readers will be interested in the statement made in New York a few days ago by Charles T. Yerkes, who came over for a business visit, that the "tubes" in London proper would be running by January 1, 1905, and that the entire system would be in working order within two years. The tunnels lie sixty feet beneath the surface of the streets. In the cases where the tunnels pass under private property the tunnel company had to buy the easement from the property owner, since, according to English law, the owner's rights extend to the center of the earth and upward an indefinite distance.

TESTIMONIAL.

NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,
(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

AMERICA'S POSSIBILITIES.

Richest Man in the Country Talks of His Early Training, Trials, Struggles and Successes.

JOHN D. ROCKEFELLER is unquestionably the richest man in the United States, and he is probably the most wealthy private citizen in the world, not excepting Andrew Carnegie. Mr. Rockefeller controls practically all of the oil output of the world outside of Russian influences, and he is interested in many other business enterprises. The Standard Oil Company, which he created, is a symposium of varied industry. There are subsidiary companies to do everything required in the trade, dig the wells, make the barrels, supply pipe for the pipe lines and take care of practically everything that enters into the operation of the industry. Mr. Rockefeller is religious and his philanthropy runs in that direction, but he has given millions for educational purposes.

Mr. Rockefeller's early life, as told by him recently to his son's Sunday-school class, was very interesting. As printed in the New York *Herald*, it is too long to give in full, but some extracts go to show the youthful trend of life and thought of a man who is at the same time the most modest and the richest man in this country. The story that he told was one of the preliminary training, the trials, struggles, successes and failures which ultimately transformed a poor country boy into one of the wealthiest men of the world. For an hour Mr. Rockefeller gave facts, narrated details of those early days, commenting on them, drawing from them aphorisms for the guidance of his hearers in their own struggles. There was nothing boastful about the address, no self-glorification.

To a business training, begun at home at the age of 8, an early understanding of the value and importance of money, hard work, carefulness and good association, Mr. Rockefeller attributed his success in life.

"We meet as friends," said Mr. Rockefeller, "and if I were to give one reason among others for my securing the first position in business—my footing, my first start in life—it would be that I had had the good fortune to be associated in my early boyhood with such dear friends as you. The association into which I was called at 14 in the church and in the schools with good men—with good young men—the association in which I found occupation in the church, in the Sunday-school, in the Young Men's Christian Association, helped me more than I can tell you to make the beginning, to begin my life work. I would name as another help in this same direction the fact that from my earliest recollection I had a peculiar training in my home.

"It seemed to be a business training from the very beginning. I was taught to do things—simple things such as a boy could do. I was taught to be self-reliant. At the age of 7 or 8 I was taught as a boy in the country to milk a cow. I could milk a cow as well as a man could milk a cow. That is a very simple thing to refer to, but that is one of the things I began to learn.

"I was taught at the age of 8 to drive a horse and to drive him just as carefully as a man could drive him. I remember very well the instruction of my father: 'My son, hold him very carefully going down the hill. Do not let him stumble, and when you are on the level road let him trot right on.'

"I shall never forget that. I was taught to do as much business at the age of 10 and 11 as it was possible for me to do. Among other things I was sent over the hills to buy cord wood for the use of the family. I knew what a cord of good, solid beech and maple wood was. My father told me to select only the solid wood and the straight wood, and not to put any limbs in it or any punky wood. That was a good training for me. I did not need my father to tell me or anybody else how many feet it took to make a cord of wood. I did not require the presence of anybody to enable me to secure from the man who sold that wood good measure.

"There were many other such like things I was taught to do, and when I was a little older my father commissioned me to build a house, and he said: 'My son, here is the money. I want you to build a good brick house that will make us a home.' I employed an architect; we made out the contracts, and we built the house. We had no trouble with the architect or the contractor. That gave me a great deal of confidence. Everything came out all right. I have the evidence of that in a little mahogany box that I treasure. I have all those receipts, all those statements that were made. That was a valuable experience for me.

"Among the early experiences that were helpful to me that I recollect with pleasure was one in working a few days for a neighbor in digging potatoes—a very enterprising, thrifty farmer, who could dig a great many potatoes. I was a boy of perhaps 13 or 14 years of age, and it kept me very busy from morning until night. It was a ten-hour day.

"I was in school, my father had a number of children to take care of; he was not a rich man, but he kept me in school until I was 16 years of age. I had expected to go through college and enjoy the advantage that many of you gentlemen have enjoyed, and I congratulate you, but I cannot say that I regret that circumstances seemed to require me to begin to take care of myself.

"I left school at 16 and entered a commercial school, where I remained for two or three months, and then, in the year 1855, I began to look for something to do, and all those years from 1855 to 1860 were very trying to us in business. Many of you gentlemen are too young to know about the dreadful panic we had in 1857. It left a blight that we did not recover from for many years. After many days and weeks of earnest endeavor I succeeded in getting a promise one morning that if I would come back in the afternoon they would see if they would give me a situation."

Mr. Rockefeller obtained the position. He was there early. His subsequent advancement to the position that he probably would not claim, although everybody concedes it, is a matter of common knowledge in America. The details would fill an entire issue of *THE AMERICAN EXPORTER*. Perhaps enough is said when it is printed that Mr. Rockefeller's fortune is so near to \$100,000,000 and is growing so fast that he can spend millions for religious and educational purposes where the ordinary rich man confines himself to thousands, without appreciably affecting his income. Mr. Rockefeller is a practical American. He has done things in a practical way. He saw his opportunities and took advantage of them. He is of the type of Americans who *do* things. His oil company is colloquially called the Standard Oil Trust. The price of oil is about one-third what it was when Mr. Rockefeller reached the point in his career that called for the formation of the Standard Oil Company. He has simply operated on the American principle of giving the best goods for the lowest price at which a reasonable profit can be made.

Laborer Rises to Be Railroad President.

ONE new instance of the chance for advancement of bright Americans has come to the surface. From a toiler in the machine shops of the Chicago, Burlington & Quincy railroad to the presidency of the Chicago, Rock Island & Pacific Railway, which is one of the Burlington's chief competitors, is the career of B. L. Winchell. Announcement of Mr. Winchell's elevation to the presidency was made last month.

B. L. Winchell, who can quote Latin or discuss the theory of Atlantis, was a country-bred boy and received a meager education in his youth. He is a self-made and self-educated man. Popularity with his employees is, according to his friends, one of the chief reasons for his advancement. He was born in 1858. He began his railroad career in the shops of the Burlington railroad in 1874. He was later transferred to the auditor's office, and from there to the passenger department. In 1880 he became general passenger agent of another road.

He was elected vice-president of the Colorado & Southern in 1888 and later president of the Kansas City, Fort Scott & Memphis. When this road was purchased by the 'Frisco Mr. Winchell was made vice-president and general manager of the larger system. About three months ago Mr. Winchell was chosen third vice-president of the Chicago, Rock Island & Pacific. These are all important railroads in the United States.

New Facts as to International Postal Progress.

FOR those who like figures and comparisons the May report of the Universal Postal Union is interesting. The statistics show that Germany is still the land with the most postal employees, and that the United States still has the largest number of post-offices. Germany counts 242,000 heads in its combined postal and telegraphic service. Uncle Sam comes next with 239,000 postal employees. Great Britain follows as third with 184,000, and all of the other countries in the Postal Union add only another hundred thousand, France with 81,000, British India with 60,000 and Austria with 59,000. Japan and Russia have about the same number of postal employees, less than 40,000.

The United States has more post-offices than other country in the world—77,000. Germany comes second with a total of 46,268. Great Britain comes next with about half of Germany's number—22,000. British India has 14,000, all of Russia 12,000, and France 11,000. Uncle Sam has the most street letter-boxes, 129,000, and Germany comes near him with 126,000, but France has only 68,000, Great Britain 58,000, British India 51,000 and Austria 31,000.

Oil Keeps Out of the Steam in Turbines.

ONE of the claims for the steam turbine is that, since it has no surfaces working in contact other than the bearings—and these are out of the path of the steam—the exhaust is free from oil and the condensation may be safely used over and over again for the boiler feed. The importance of this advantage may be realized, when it is remembered that the water bill for some of the large metropolitan stations is upward of \$70,000 per year. In the earlier machines some oil did work into the low-pressure end, being drawn in by the vacuum from the contiguous bearing. The *Central Station* suggests the moving of this bearing away and the use of a stuffing-box between it and the low-pressure end. This suggestion has been anticipated by the better expedient of putting a little centrifugal pump back of the bearing, as shown in our April issue, which pump maintains a water pressure in a chamber through which the oil would have to pass greater than that of the atmosphere, and prevents the atmosphere from pushing it in. At the same time the water is kept away from the shaft, so that it does not enter while the turbine is in operation.—*Power*.

Wanted, Oil Mills.—A. Marsden, Chief of Customs in the East Africa Protectorate, says in a recent report: "It is difficult to understand why no attempt has yet been made to erect oil mills for the production of castor oil. Considerable quantities are used by the Uganda Railway, and hitherto it has been imported from India at a price varying between Rs. 2.6 to Rs. 2.10 per gallon. For the most refined quality I believe an elaborate and expensive machinery is necessary, but a fair marketable quality could be turned out by an ordinary mill, such as is used for the extraction of coconut and sim sim oil. The two protectorates are full of the castor oil plant, which grows in profusion and requires no cultivation."

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices.

Our watch factory is the largest in the world devoted solely to manufacture of timepieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

American Competition vs. German Trade.

UNITED STATES CONSUL GENERAL MASON, at Berlin, Germany, in a recent report to the Department of Commerce, presents some new facts regarding trade between the two countries. He says in part: "As part of the general industrial development of Germany there is a feature of growing importance concerning which little seems to be known or realized at home, and this is the productive capacity of manufacturing plants established in this country by Americans themselves, equipped with American machinery and operated under American direction and methods. Probably no European country has so many of these offshoots from American manufacturing industries as Germany, which grants to such alien enterprises practically the same privileges and requirements granted and imposed upon native firms and companies.

"Legal obligations to labor, police regulations as to solid and fireproof construction, and other legal conditions make factory management in Germany more difficult and troublesome than at home, but the American managers comply successfully with all such obligations and, being on the same footing as their native competitors in similar lines, they have a definite advantage for the European trade over their own or rival firms and companies in the United States.

"This advantage embraces several elements—the saving of ocean freight and import duties, the employment of cheaper labor, and the fact of being able to compete as local manufacturers for municipal and Government contracts that would not be accorded to foreign bidders. The net result is that there is built up within the frontiers of European states a vast group of manufacturing establishments of the most modern type, based to a large extent upon local capital, but enjoying all the advantages of American experience, machinery, and operative skill, for the managers and foremen of these factories are picked men from the factories in the United States.

"Their workmen are mainly natives and there is thus set up a series of special industrial schools, where men and boys from the best class of local operatives are trained by American experts in the subtlest details of their craft. And when, as happened during the depression of 1901-2, a large electrical manufacturing establishment of this class at Berlin got into a situation where expenses had to be reduced an American industrial doctor was sent for to diagnose the case to the last detail and prescribe the proper remedy. There are thus to-day, among others, within the limits of Berlin an outgrowth of the great machine-tool works at Hamilton, O., U. S. A., three large electrical manufacturing companies closely allied to similar organizations in the United States, and one of which is a direct offshoot from the parent factory in Brooklyn, U. S. A., and is, perhaps, the principal producer of small electric motors and paper insulators for the whole of Germany.

"An American match factory in Baden practically dominates that branch of industry in southern and western Germany. The Luxfer prismatic glass and American radiators are made here by branch works of the home companies, and an American factory at Hanover supplies pneumatic brakes for the whole Prussian railway system. Another important combination is that which has been recently concluded between the American General Electric Company and the Allgemeine und Union companies, of Berlin, to unite in the possession and working of the Curtis and Riedler-Stumpf patents for steam turbines and turbo-dynamos. They have mapped out in combination their respective spheres of influence, and their operations will cover exclusively, so far as their patents are concerned, the whole of Europe and America."

Consul-General Mason in commenting upon the facts heretofore set forth, fears the results will be to curtail the export trade of the United States, in which view we believe he is mistaken. American methods and machinery are constantly improving. Machines that make machinery wear out in five years or so and sometimes before they lose their usefulness in America there are new and improved machines that make it a matter of economy to replace the old with the new. Whether Germany buys our machinery or our products, there is no danger of a diminution in our exports to that country, at least not for the reasons mentioned in the consul-general's report. On the whole, we are inclined to consider that the conditions he reports show a remarkable and not unexpected appreciation not only of the worth of our manufactured exports, but of the machinery used to put them into form. Taking also into consideration the growth of the demand of enlightened humanity for the necessities and luxuries that most people are now able to afford, it is a recognition of American progressiveness, as well as an exhibition of German acuteness of discernment, that our machinery is in favorable request in that country.

The American Invasion of Mexico.

MEXICO is one of our North American republics, but it has attracted less attention than circumstances seem to justify. From information given in an article in the *Booklovers' Magazine* for June it would seem that Mexico is almost a part of the United States. The writer points out that the extent of the American commercial invasion of Mexico is not fully realized by a majority of people. A year ago it was officially reported that more than eleven hundred American companies were doing business in Mexico. Of the capital from this country invested there about 70 per cent. is placed in railroads. All of the lines except those connecting the capital with Vera Cruz and the National Tehuantepec Railway are owned or controlled by Americans. Eighty per cent. of all Mexican railroad property is held in the

United States. Eighty millions of American dollars are engaged in Mexican mines, principally in Sonora, Chihuahua and Durango. The mining outputs of the fiscal year ending June 30, 1903, amounted to \$145,000,000—valued in silver—being an increase of nearly 50 per cent. over any preceding year. In the same time nearly three thousand new mining enterprises, or 17 per cent. of the whole, were launched.

In various agricultural ventures Americans have \$28,000,000 staked; but this includes probably some of those enterprises which appeal to the trustful small investor through popular advertisement, and concerning which our consular agents have often sent warnings to the Washington authorities.

Varied manufactures in the Federal districts and in Nuevo Leon absorb much American capital. In Sinaloa we also operate a profitable group of sugar refineries. To the northward many great iron and steel plants are in evidence. One of them, just completed at Monterey, has cost fully \$10,000,000.

Close Contest for Lead in Domestic Exports.

IT is quite apparent, according to the figures of the American Department of Commerce, that the United States is to head the list of nations as an exporter of domestic products in the fiscal year which ends with the coming month. The contest for supremacy as an exporter of domestic products has been for several years between the United Kingdom and the United States. Until a comparatively recent date the United Kingdom stood at the head of the list.

During the past few years, however, the United States has on several occasions exceeded slightly the figures of the United Kingdom, and the latest statements of exports make it evident that in the fiscal year 1904 the United States will be considerably in the lead.

The figures of domestic exports of the United Kingdom for the nine months ending with March, 1904, were \$1,073,538,366, and of the United States, \$1,149,330,670, the total domestic exportation of the United States for the nine months in question being thus \$76,000,000 in excess of that of the United Kingdom. These figures, it will be observed, end with March. For the month of April the figures of the United States, as announced by the Department of Commerce are \$107,535,655, against \$107,692,056 of domestic exports in April, 1903. While the figures of the United Kingdom have not yet been received, it is apparent that no sufficient change could possibly occur in the two months to reduce the certainty that the total exportation of domestic products from the United States in the fiscal year ending June 30th next will exceed that of the United Kingdom or any other country.

A further study of the exports of the United States compared with those of other principal countries shows that not only is the United States the largest exporter of domestic products, but that its exports have grown with greater rapidity than those of any other country.

Our Novelties in Demand in Foreign Lands.

THERE is a quick, eager market in foreign lands for novelties, for practically every new thing, be it a machine, a new lamp, or motor, or fixture of any kind that is inherently original and superior and will do its work cheaper or better than anything of the same kind now in use—the sort of things that Americans are continually turning out. Attention to the fact is called by United States Consul-General Mason, at Berlin, who also says: "Nowhere is the ingenuity and mechanical skill of Americans, their mastery of industrial methods, and their restless spirit of progress better understood and more highly appreciated than in Germany. Nowhere can an American with a really improved machine or product find a more prompt and ready purchaser than here.

"As examples of the kind of machine tools that are wanted may be cited the following that have been recently inquired for: A full equipment for making small tubs for butter, lard and other oleaginous products; a machine for cutting a spiral peel or veneer from round logs, which is used for making small boxes and baskets; and bending machines for shafts, fellies and other parts of vehicles. An automatic machine for trimming slabs of seed-oil cake was recently offered in Germany by an American inventor and proved to be superior to the English apparatus now in use for the same purpose. There is, of course, the consideration that every such machine sold and installed in a country like Germany only equips and strengthens this country for keener competition with American manufacturers at home, but such are the chances of international trade; we must recognize facts as they are."

American Machinery in Germany.

H. W. HARRIS, United States Consul at Mannheim, Germany, thus comments upon the opportunities for American machinery in Germany: "There are many lines in which the American machine and implement manufacturer may fairly hope to share in the trade of Germany for many years to come. This will be especially true when his wares are protected by patents, when he can produce them at a minimum of cost, and when cheaper raw products or other causes may assist him. Simplicity of construction, speed of operation, durability, ease of adaptation to various conditions, and relatively lower price will continue to commend our machinery. Each year will continue to emphasize anew, however, the fact that the German machine and implement manufacturer is alert to the situation and has made marked progress in all directions."

Special attention given to filling Export Orders. Send for Illustrated Catalogue and Export Price List. Order through buying and shipping agents, and send us duplicate of orders, so as to avoid mistakes.

Stanley's Success and American Enterprise.

MOST of our readers know a great deal about Sir Henry M. Stanley, G.C.B., D.C.L. and LL.D., who died in London last month. He was regarded in this country as much more than half an American, for he obtained his start in life here, and it was New York enterprise that made possible his great achievements. Without the backing of the New York *Herald* he could not have won his chief successes of interest, indirectly at least, to international trade. This account of Stanley's career, published in the *Week's Progress*, gives less credit to the American who furnished Stanley with the instructions and the money to carry out his exploits than ought to be given, but it is the most condensed story of his life that we have seen:

"A pauper child, named John Rowlands, was reared in a poorhouse in England. Sir Henry M. Stanley, G.C.B., D.C.L. and LL.D., died in London on May 10th. The two were one, for the pauper child beginning life in the almshouse, then setting out as a cabin boy, was adopted by a New Orleans (U. S. A.) merchant, whose name he took, and became famed as an explorer, as a lecturer and as the man who found Livingstone and who led the expedition which relieved Emin Pasha. So much for force of character. During the American Civil War he served in the Confederate army because of his Southern predilections and later reached New York, where he sought journalism as the opening for his talents. Being connected with the New York *Herald* under the elder James Gordon Bennett, he was sent in 1868 to Abyssinia with the British expedition. A year later, purely as a journalistic enterprise, the proprietor of the New York *Herald* started him off at the head of an expedition to find Livingstone. This was journalism—reporting on a large scale—which makes some modern newspaper reporting feats seem small. Dr. Livingstone, the missionary and explorer, had been missing and unheard from for two years. Stanley was sent to get news of him. He reached Zanzibar in January, 1871, organized his search expedition and started for the island in March, with 192 native followers. He found Livingstone at Ujiji, on the shore of Lake Tanganyika, in the following November, furnished him with supplies, explored the lake with him and then left him just as Livingstone started out on his last expedition, during which he died. Stanley returned to England in March, 1872, and found himself famous. The British Association entertained him, Queen Victoria sent him a gold and diamond snuff-box and the Royal Geographical Society dined him. In 1873 he was sent to Africa again and explored Lake Victoria Nyanza after great hardships. He descended the Congo in a memorable trip of eight months and came back to civilization on a Portuguese man-of-war. Then, in succession, he explored the Congo and founded the present Congo Free State, and Stanley Pool on the Upper Congo is named after him. His last great work was the relief of Emin Pasha, who had been left behind in Central Africa when the Mahdi swept over the Soudan, wiping out the outposts of Egyptian civilization. He found Emin and brought him home. He was decorated with the Legion of Honor and for his achievements distinguished honors have been paid him. He was made a member of Parliament and has written many books of travel and of exploration."

A "Corner" in Rubber Considered Impossible.

RUBBER is a commodity of trade which receives little attention in the public prints, but is, nevertheless, an important and interesting element of commerce. We recently received a communication from a subscriber in Paris asking some questions concerning rubber. A writer in the American magazine, *Cent Per Cent*, gives some information that fully answers our French friend's inquiry and which may interest other readers as well. This writer says:

"It must be noted that the manufacturers of rubber goods, as a rule, have never been accustomed to study the conditions which make the prices at which they buy in the market nearest to them—Americans at New York, the British at Liverpool, and so on. But rubber may change hands many times between the forests and these markets, and the only rubber that is really controlled by the importer at New York, for instance, is what he actually has in hand at any moment.

"The interest to us at this moment is to consider whether crude rubber can really be 'cornered'; or, rather, whether the increasingly higher prices for several years past have actually been due to speculative influences. It must be considered, in the first place, that the rubber which comes every year to New York and to the leading markets of Europe is derived from many hundreds of sources, each contributing a relatively small amount. For instance, hundreds of merchants at ports south of the United States owing money to New York merchants make occasional shipments of produce against these credits, either direct to these merchants, or to New York banks for their accounts. It is the same thing with the rubber which finds its way to Europe. In order for rubber to be 'cornered,' it would be necessary for all of these numerous consignments—from hundreds of Southern shippers to scores of New York houses—to be controlled by one influence, and of this no proof has been forthcoming.

"But suppose all the rubber consigned to New York were controlled by one speculative agency, what about the shipments to Europe, amounting to about the same every year in volume? Rubber is received at Liverpool, London, Hamburg, Havre, Lisbon, Antwerp, and so on—in every case from parties whose interest it is to make shipments direct to this or that port. And if, tomorrow, the price of rubber should be 1 cent a pound lower at any one of these ports than at another port, New York included, that port would at once

receive orders for rubber, since 1 cent a pound means \$20 a ton, and at that difference it pays to ship rubber.

"The fact is that no influence under the sun controls the amount of production of rubber in any country, as well might one try to control the number of tribal disturbances among the innumerable families of Indians who, in the first instance, produce the rubber. But when the rubber does find its way—in boxes and bags and barrels and bales and in skins of animals and in loose packages—to such markets as New York and Liverpool, the selling price is affected very materially by the state of the demand. If the stocks at a given date are small, and the buying demand is very active, prices go up; if conditions are reversed, prices go down.

"To sum up, it is a serious mistake to regard existing rubber prices as due to any important extent to other influences than the ordinary laws of supply and demand. The intending producer of rubber, therefore, can confidently look for a profitable return for his investment, even for generations to come, if not to the end of time."

American Water-Filtration Plants in Russia.

IN many of the cities of Russia the American system of water filtration has been adopted. Owing to the turbidity of the large rivers in Russia, they are very objectionable as sources of supply for municipalities or for such manufacturing purposes as paper-making, bleaching, dyeing, the making of chemicals, etc., unless the sedimentary matter carried in suspension is first removed. In 1898 the chief engineer of the Moscow water-works was sent to the United States to investigate and report on the American system of rapid filtration. On his return to Russia experiments were undertaken which demonstrated that by the American system extremely turbid waters could be rendered bright and clear at a rate of filtration fifty times as fast, and with only about one-thirtieth of the space required under the old sand system, while from the sanitary standpoint the bacteria were reduced over 99 per cent. The lessons taught by these experiments at Moscow resulted in the installation of the American system at Moscow, Nizhni, Novgorod, Tzaritzin, Ribinsk, Balashoff, Amarvir, Vladimir, Simbirsk and Tomolsk. In addition to these American filters have been used for manufacturing purposes on a large scale at Kostruma, Yaroslav, Orekhov-Zoujere, Tver and Moscow, and others of this description are now in use by the Russian Government at its navy department in St. Petersburg.—*Thomas E. Heenan, United States Consul at Odessa, Russia.*

High Praise for American Thrashers.

MR. JOHN SAMPSON, editor of the *South American Journal*, in a letter to the *Mark Lane Express*, of London, England, says: "The American traction engine is rapidly ousting the British type in Argentina. It is claimed that it is lighter and can get more easily over the ground, and, in fact, can cross places where the heavier English engine would be stuck. The system of short stroke with rapid revolution is said to be much better for the requirements of the conditions than the older pattern. Many American engines are being sent out with English thrashers. The price of the American engine is also considerably less. It was long an axiom at the River Plata that the English thrashing-machine could hold its own against all rivals. This is no longer the case. American thrashers are daily becoming more in use, and for the simple reason that they are able to do much more work in a given time. An English thrashing-machine will turn out 1,500 to 2,500 bushels of wheat per day and require the services of 18 to 21 men; whereas the American machine will deliver 4,000 to 6,000 bushels and only require the aid of 8 to 10 men. In a country where harvest hands are scarce and highly paid—as much as \$1.44 per day with food—this is important."

Agricultural Machinery Needed in Egypt.

EGYPT offers a valuable field for American agricultural manufacturers. The country is greatly increasing its production of cotton and corn, and when these are harvested the soil is again cultivated for the growing of wheat, barley, clover, etc. To do this properly, Egypt has found it necessary to have various kinds of farm machinery, which, however, must be imported. In 1903 the imports of steam engines amounted to \$441,000; steam boilers and steam-machine parts, \$545,000, and other machinery and machine parts, \$720,000.

Joseph J. Langer, the United States Consul at Solingen, Germany, reports that German manufacturers, to successfully introduce motors into Egypt, are endeavoring to post themselves as to the real requirements. They desire to be reasonable in price and terms of payment and to furnish a machine that is durable, but still simple enough to need no skilled mechanic to operate it, so that the native laborer can handle it successfully.

New Field for American Plows.—The Governor-General of Algeria has recently issued a circular advising the natives to discard the antiquated plows, now generally used, in favor of modern implements. Of the 2,800,000 hectares in Algeria devoted to the growing of corn, more than 2,300,000 are cultivated by natives. If, therefore, the Governor-General's suggestions are adopted—and it is proposed to allocate grants of money for the purchase of suitable implements—there will be a good opening for American plows in that part of the world.

ESTABLISHED 1846.

ESTEY ORGAN COMPANY,

Brattleboro, Vermont, U. S. A.

Cable Address: "Estey," Brattleboro, U. S. A.

Builders of High-Grade Organs and Pianos

Over three hundred and fifty thousand (350,000) in use throughout the civilized world.

The **Estey Reed and Pipe Organs** are specifically made for use in churches, chapels, music and lecture halls, Masonic lodges, schools and residences.The **Estey Pianos** are made in several styles of Upright and Grand.

Our Catalogue, illustrating and describing the various styles of Organs and Pianos made by us, mailed postpaid to all parts of the world.

None but the most skilled workmen and the best of material are employed in the making of the **Estey Organs and Pianos**. Prices quoted F. O. B. cars at New York City. Specify "Estey," and when ordering, to avoid errors, please mail us a duplicate of order.

NOTE.—To facilitate the handling of our export trade we desire to communicate with one responsible musical instrument dealer in each trade center of the world.

ESTEY PIANO. Style 20.

Made in mahogany, oak and American walnut. 7½ octaves, scale A to C. Height, 4 feet 3 inches; Length, 5 feet; Depth, 2 feet 3 inches; Weight, boxed, 850 pounds.

ESTEY ORGAN. Style "S."

Solid walnut or oak case. Height, 6 feet 8 inches; Breadth, 3 feet 10 inches; Depth, 1 foot 11 inches; Weight, boxed, 400 pounds.

"NEW JERSEY" COPPER PAINT

LEADS THEM ALL,

So Our Testimonials Say.

We guarantee this Copper Paint to be the easiest to apply and, owing to its being so finely ground, it is the smoothest paint in the market.

Highest Medals from National Export Exposition and American Institute, New York City.

New Jersey Yacht Red Copper

For Yachts. Brightest Color Made.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with **New Jersey Copper Paint**, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where **New Jersey Copper Paint** was applied—it is in splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.
MILLS EDWARD, Master Schooner "Florence Shay."

AGENTS WANTED EVERYWHERE FOR

THE BEST LIGHT

The Cheapest and Strongest Light on Earth.

Makes and burns its own gas. It is portable; hang or set it anywhere. Requires no pipes, wires or gas machine.

A Safe, Pure White, Powerful, Steady Light. Permitted by Fire Insurance Underwriters.

No wicks to trim; no smoke or smell.

SUPERIOR TO ELECTRICITY OR ACETYLENE AND CHEAPER THAN KEROSENE.

Saving effected by its use quickly pays for it. Over one hundred styles of fixtures for indoor and outdoor use. This is the Pioneer Incandescent Vapor Gas Lamp. It is perfect. Beware of imitations.

German Editor's View of New York City.

A GREAT many European journalists and authors have come to the United States this year on account of the St. Louis Exposition, in order to study American institutions and conditions, and the letters containing their critical remarks and observations, as found in foreign papers, offer highly interesting reading for Americans. H. von Kupfer, editor-in-chief of the Berliner *Lokalanzeiger*, says:

"New York is full of noises, but not at all noisy. That may be considered a paradox. However, any one who has witnessed New York life must consider that remark justified. It is like the commotion of an ants' hill, the humming of swarming bees. The noises in the Paris and London streets are greater. In addition to that, the thundering noises made by the elevated trains crossing the city in parallel lines seem to be, as it were, absorbed by the countless electrical surface railroads. The continuous noises may be responsible for that part of its impression upon the hearing, it being lost, but as far as the effects upon the nerves are concerned, I'll leave that question undecided.

"New York, however, since I have seen the city—eleven years ago—has entered a period of progress that cannot be described. There are those 'skyscrapers,' unesthetic products of despair over the tremendous real estate values, and the subway railroad, although nearing its completion, transforming the city into a chaotic condition that, in some places, must be considered as endangering life.

"As far as the building operations are concerned, much has been changed. Much beautifying of the city has been done, but 'progress' as to the monstrous and gigantic dimensions of buildings is especially astonishing, and the average sale of real estate during one week, amounting to \$10,000,000, may give an idea of New York building activity.

"It would, however, be unfair to judge the city's development from that alone. In conversation with people who ought to know, as from personal observations, I learned that municipal affairs have been more developed, which must be considered the more important because the 'unlucky political office-seeking' is responsible for making difficult any progress in matters of public welfare. The 'boss' of a political party secures for his friends and constituents 'fat sinecures' without regarding the capability or incapability of the men selected to work for the public. Under these circumstances it is highly instructive for us to know that the leading city of North America is about to enter into competition with the Old World in what heretofore always has been our special pride—i. e., the best development of hygienic conditions for a great city, as well as the public safety and other things that were not what they should have been in former years."

Accuracy of Our Large American Rifles.

THE "fire control" in the United States coast fortifications is in the hands of a mathematician in an observatory. An officer in the observatory makes a calculation of the distance of the ship to be hit, its rate of movement, the force of the wind, curve of flight of the projectile and the time occupied in raising the gun. He then, by telautograph, gives the gunners the direction and proper elevation in which the shot is to be fired. The points of the compass with fractions of degrees are marked on the circle upon which the rear wheels of the gun-carriage travels. The gunners do not see the target; the gun is raised by machinery above the bank behind which it is hidden, fired and returned by its recoil, an air-cushion easing the jar.

At Fort Barancas, Pensacola, on the Atlantic coast, three shots from a 12-inch gun were fired in as many minutes at a small scow 2½ miles away and moving at the rate of five miles an hour. The mark was hit each time. Being divided into watertight compartments it floated until struck by the third shot.

United States Will Try Turbines.—The American Navy Department has determined to equip two of the new scout ships ordered by the last Congress with different types of turbine engines, and one with the old reciprocating type, in order to experiment with the different turbines and to compare the merits of the new and old style driving powers. One of the ships will be equipped with the type of turbine engine built by the Parsons Company, a firm controlled by the Westinghouse Electric Company, and another with a turbine engine constructed by the Curtis Company, of New York. The third scout will be equipped with engines of the reciprocating type designed by the Bureau of Steam Engineering of the Navy Department.

Agriculture in Abyssinia.—This country ought to prove a good field for the exploitation of American agricultural implements. United States Commissioner Skinner, regarding whose mission into the country we have given some account in previous issues, says regarding the region: "The climate of Abyssinia is so varied that the soil is necessarily adapted to almost every form of agriculture. In regions where there is plenty of water the summers are so long that in certain localities the planting and harvesting of crops take place simultaneously. In most regions two crops are gathered annually, and frequently three."

American Furniture in Belgium.—But very little machine-made furniture is sold in Liege, and while at Maline some small factories are engaged in manufacturing this article it is of the crude and ordinary kind and in no sense does it compare with the machine-made specimens of American manufacture, either in rich appearance or quality.—James C. McNally, Consul, Liege, Belgium.

Farm Wonders of Our State of Oregon.

SOME of the products of the States in the Pacific Northwest section of the United States show such remarkable development that it may be called the agricultural wonderland of the North American continent. An eminent authority tells how a farmer in the Hood River country, in the State of Oregon, raised on four acres 800 bushels of potatoes that nearly all ran from three to eight pounds apiece. There was not one in the lot that weighed less than a pound. Squashes weighing as much as a large man, pumpkins tipping the scale at the hundred-weight, watermelons larger than the Southern pickaninnies, whose eyes would bulge at seeing them, turnips larger than one's head, pears and apples with a circumference of half a yard, are to be seen at the annual fairs of Salem and The Dalles.

The biggest apples, the biggest pears and the biggest cherries at the Chicago Exposition were from Oregon, and the charge cannot be made against them that what they gain in size they lose in flavor. The Pomological Society, which is the highest authority on fruits in the country, awarded to the State of Oregon the Wilder medal for the horticultural exhibit at the Pan-American Exposition, and Oregon expects to win similar honors at the St. Louis Exposition now in progress. The State stands first in the production of hops, raising about one-third of the country's total production.

So far as is known there is no spot on earth, with the exception of eastern Oregon and Washington and the adjoining valleys of Idaho, where three or four crops of wheat may be harvested from one sowing. Yet, since the first settlement of the country, these "volunteer" crops have been reaped. A second crop from a single seeding is officially reported to have yielded thirty bushels to the acre.

An Era of Big American Locomotives.

THE advent of the "biggest locomotive in the world" is so frequent of late that chronicling its arrival has become monotonous. Now it is a Baldwin, for a Western road, which weighs, with tender, nearly half a million pounds. The railroad has provided extra heavy rails for this type of locomotive, and will install seventy of them in its freight department. The first twenty-five are to be equipped for soft coal and the rest for oil fuel. Again, it is the American Locomotive Works which has under way the building of the largest locomotive in the world. It is to be of the Mallet articulated type, will weigh 465,000 pounds when completed, which is 207½ tons, and is intended for freight work on the Baltimore & Ohio Railroad. The machine will be of the tandem-compound style, with a peculiar arrangement for driving wheels and cylinders. It is being built as an experiment, and is intended for use as a helper on the mountain divisions of the road. The heaviest engine now in use on the Baltimore & Ohio Railroad weighs 162½ tons. The new locomotive will have 320,000 pounds on the drivers, a tender weighing 143,000 pounds, with coal capacity of 13 tons and a water capacity of 7,000 gallons.

"England and Us."—The Newark (U. S. A.) *Advertiser* says: "Peace hath her victories,' etc. An American concern—a Jersey one at that—which is putting in gas furnaces in the London mint, has received a contract for the installation of others in the Woolwich arsenal. Just a few generations since the weapons of the two were turned against one another in mortal strife, and now we are sending the mother country apparatus and the real 'sinews of war,' the coin of the realm! We have long been sending 'coals to Newcastle' and shiploads of the 'roast beef of Old England' in life fattened on the cattle ranges of our Western plains. We raise the grain for the 'mother country's' daily bread. What would she do without us? What against us? Carnegie has just been telling the Britons the fix they would be in in case of Uncle Sam's active enmity. It looks as though they didn't have to be told."

American Motor Cars in Scotland.—Some types of American cars, both medium and light weight, are selling well and give satisfaction. They seem to meet perfectly the requirements of the trade, and it has been a subject of comment that so few American makes of cars were seen at the Edinburgh show this year. Such opportunities for advertising a specialty of this kind come so seldom that not one should be neglected by any motor car company or firm seeking foreign trade.—Rufus Fleming, United States Consul at Edinburgh.

Strength.—Some American-made woodworking tools may be too light, just as some European tools are certainly heavier than necessary. Strength where needed is the thing.—*Woodworker*. American tools invariably combine both the qualities of lightness and strength, except when weight is absolutely necessary.

Opening for American Furniture in England.—If American furniture were placed on the market here, where English made—old style and heavy—is in use, and properly pushed, I think a profitable trade could be built up. Furniture can be exported from the United States to Hull at reasonable rates.—Walter C. Hamm, Consul, Hull, England.

Powerful Searchlight.—The most powerful searchlight in the world is at the St. Louis Exposition. It weighs nearly four tons, is of 5,250,000-candle-power and projects a beam of light seven feet in diameter.

HAVE YOU SEEN THE

**Schroeder
Rotary
Washer ?**

It is the most perfect and successful Rotary Washer on the market. The tub is made of red Louisiana cypress, which will not fall apart. All castings are finished with rust-proof aluminum paint; all iron parts coming in contact with the clothes are heavily galvanized. We also make other washers. For particulars address

LUDINGTON, 40 to 50 Rowe Street, MICHIGAN, U. S. A.

How Great Electric Companies Train Their Men.

TO supply the needs of a business requiring technical and scientific knowledge is a great and serious problem, considering the competition and the progress that must be faced continually, says a writer in the *American Inventor*. Business is a warfare that never lets up. It fights on to conquer or surrender perhaps in time to new conditions or circumstances, but fights on even then under a new flag, and the army must be recruited.

Engineering schools may turn out electrical graduates to the number of 2,000 per year, and each one may have a knowledge of strength of materials, hydraulics, steam engineering, French, German, Calculus and Quaternions, physics, dynamo electricity, three years of draughting and designing and four years of laboratory work and college machine workshop, but the moment he sets foot in an electrical factory or power-house he finds he knows nothing well enough to be as good as a regular hand.

Time will ripen him, but he is green. He doesn't know a polyphase motor from a turbo generator, and if he were told to set up such a piece of machinery and start it going he would have to look up for days weights and dimensions that he might know how to lift and set them into position. The great American companies of the present start out with the idea of teaching men how to take hold of work, to get their hands soiled, to go after a task like a dog goes after a rat. One company which the writer has in mind selects from the promising graduates of each year enough to constitute 200 students who pursue courses running two, three and four years in the business.

The two-year students are technical graduates from various institutions throughout the world, while the three and four year students are men of aptitude, but no special training for the business further than common school or general courses. Men of the two-year class (in which at present there are no vacancies) serve sixteen months in the various departments devoted to the different kinds of electrical apparatus manufactured by the company.

Starting in the winding department, for instance, these men are given a check number as a regular man and taught to wind coils for insulates and finish copper wire coils for transformers, armatures and field windings, being required to stand the same discipline as the regular hands, to work the same hours, and, in some cases, to get out the same amount of work. From winding, with the knowledge of all the fine points required, as well as that of winding-machines, tools, methods of best handling wire, cutting, joining, tapping, tying and arranging, the student goes to the insulation of coils, the assembling of transformers, building of iron around the coils, connecting of transformer coils, casing and general finishing.

It is possible that the student will go into the department constructing large machines. Here he will take a hammer and chisel, and laboriously chip burrs from large castings, cut dynamo-pole faces and smooth ugly parts of castings or nicks left by the molds of the foundry. Later, with air-drills, he helps to set brush-holders in place, sliding rails for generators, terminal boards, helps to bend and make copper straps for large generators and motors, helps to rope and put coils in position and connect them properly, trim and finish castings faced to go together and to bolt together finished parts.

A month of this will make a student glad perhaps to get into winding, where the intricacies of alternating current, one, two and three phase, open and closed windings, as well as the continuous current windings, will keep him busy for many months. He emerges from this department with a full knowledge of every material used for insulating and working with winding, as well as valuable ideas about the hauling of great weights with care and precision, and ways of going at each job of winding with great saving of time and material. He also becomes well acquainted with all soldering processes and methods.

The student is then allowed to work at setting up large machines for test. This work is a foretaste of construction work in the installation of electric plants. Passing on to the departments, manufacturing, commutators, controllers, brush-holders, he, in time, enters the department of manufacturing street car motors. Here he follows the same scheme on larger work, helping to finish the machine motor cases, place the field coils in and connect them up, insert the plate and other necessary features, principally the armatures, bolts up the top and bottom and thus sends the finished machine up to the testing-room to be tested. Further work in this department ends with the commutator, the soldering of the armature, commutator turning. He is kept in this department for two months. From this department he is perhaps transferred to the manufacturing from bar and plate copper switches and circuit-breakers and from various materials, rheostats, switchboards, oil switches, armeters, voltmeters, ammeters, and indicating recording instruments of all kinds, together with a world of small parts.

A year has more than elapsed before the student has mastered the processes and drawings of the various machines seen. By this time he has become somewhat familiar with the technics of the business and is allowed to serve for a time as assistant to some of the eminent engineers in the designing offices, who there have a chance to size him up as a future co-worker. Other office experience presents itself to the student in engineering, accounting, construction departments and a thorough knowledge of and intimate practical work with opportunities is afforded in one of the several testing departments. This has taken up altogether a year or so, when the student becomes available material for the sales, construction, engineering, correspondence, draughting and executive departments.

Against such a campaign of education it is hard to see where any gap has been left open for weakness in the crucial test of competition. With capable men to step into the shoes of rising officials, a system is arranged for a con-

tinuation of authority that cannot but keep fresh for business struggles against smaller concerns depending on chance to secure brains and energy—concerns that take raw material and make finished, useful products of them which fulfil the guarantees, sell, stay sold and produce a market for more of the same kind.

Electrically Lighted Dials for Watches.

IN old verge watches dials were enameled and the twelve hours in relief enabled blind persons to ascertain the time by feeling with the finger. Now electricity comes in its turn as a means of lighting the dials of watches of twenty-four to thirty lines, called carriage watches.

The following is the system, as described in the *Jewelers' Circular-Weekly*: The dial is, ordinarily, of metal or enamel. An oval depression is cut on the lower part of the figure XII and omitted in the upper part. In this hollow is a minute incandescent lamp, a small hollow glass bulb with a platinum wire inside, which lights the whole surface of the dial. The glass is cut on each side of the pendant for conducting wires coming from a dry battery, placed under the seat of the carriage. For an automobile a special battery is not necessary, since this vehicle carries in its mechanism a battery for lighting which will furnish when wanted the electricity for lighting the dial throughout.

To a pocket watch whose dial shall also be lighted by means of electricity there is but a single step. Indeed, it will be sufficient to connect the two conducting wires with the two poles of a dry battery carried in a pocket of the wearer. In order to make sure of the duration of the energy of the battery, a contact button should be installed in the case of the watch, so as not to close the circuit—that is, not to make use of the battery except at the precise moment of ascertaining the time.

The principle of this system is not new, for luminous jewels have been in existence for a number of years and have played their part in a successful piece as theatrical novelties.

New Devices to Print Without Types.

PRINTING without types is one of the latest innovations that American inventors have been at work perfecting, and there are three companies in New York City that are about to put on the market devices for that purpose. One is capitalized at \$10,000,000. The process is as simple as a, b, c. To begin with, a typewriter with the standard keyboard is used to "set up" the copy, not in letters, but in perforations in an endless strip of paper. The complete tape looks somewhat like the music used in automats that play the piano. The strip of paper is passed through a machine which prints, with justification, sheet after sheet of matter of the required size—a book page or a newspaper. Impressions of this printed stuff are then made upon aluminum or zinc plates as thin as ordinary sheet iron, which are placed with equal facility upon both the bed-and-platen and the cylinder presses.

One of these typeless machines is called the "planograph" and another the "lithotype." The principle of printing from plates as smooth as glass is this—water and grease won't mix. The text is put on in ink, the basis of which is grease. Enormous pressure is used, the typewritten piece of paper being laid flat upon the zinc plate and pressed under heavy rollers. In printing the ink rollers pass over the entire plate, but leave ink only upon the inked impression, for the rest of the plate—all the spaces between the letters—is covered with water from a water roller, which abhors ink. As many as 164,000 impressions have been taken from one plate.

More American Equipment for London "Tube."—American condensers are to be installed in the huge power house which is being constructed at Chelsea, London, S. W., by the Underground Electric Railways Company, usually referred to as the Yerkes syndicate. The International Steam Pump Company secured the contract, which is valued at \$125,000. The British Westinghouse Electric and Manufacturing Company, Limited, secured the contract for the electrical equipment, which will represent an expenditure of fully \$3,000,000.

New Electric Plant Contemplated.—South African advices state that a company is in process of formation in Johannesburg for the purpose of erecting a central station to furnish electric power to the mines and also to supply such demands for public light and power as are not met by the corporation's own scheme. The existing equipment of most of the mines in the district is of very obsolete and nondescript type. Here is an opportunity for American enterprise.

American Electric Instruments for Scotland.—The General Electric interests have secured a contract from the Glasgow Corporation for six large high-tension transformers for installation in the Port Dundas plant of the electric traction system in that Scotch city. They have also taken a contract for several cars for the Keighley Corporation tramways.

American Equipment for South Africa.—The General Electric Power Company, Limited, of Germiston, South Africa, is to considerably extend its plant. The existing equipment comprises Curtis turbines and Stirling boilers. More American equipment will be ordered. The company is to extend its power service to the mines in the vicinity.

There may be valuable mineral, gas or oil on your property. It does not cost much to find out.

There may be a Fortune in your Ground.

THE PORTABLE STAR DRILLING MACHINES

are the best ones ever put on the market.
They are entirely without springs.
Are simple and efficient.

L. F. Keith, of Maryville, N. Y., says:
"My three Star Machines have been giving perfect satisfaction. I have drilled 60 feet in rock in one day of 10 hours."

Miles Dean, Newton Falls, O., writes:
"For the last 3 years I have operated 6 Star Machines and they do all you claim for them and more too."

The land belongs to you clear down to the center of the earth. Probably there is vast value deep under the surface that would pay well to develop.

Star Drilling Machines are Made in 10 Sizes, to Drill from 250 to 2500 Feet.

We also Manufacture Drilling and Fishing Tools.

Send for Illustrated Catalogue.

WOODWARE SUPERSEDED BY THE INTRODUCTION OF THE

International

(Galvanized Steel)

Washing Machine.

Will wash fabrics, coarse or fine, as quickly and cleanly as any washing machine made, and being made of **Galvanized Steel** will outlive and outwear ANY THREE Wooden Washing Machines.

The galvanizing is performed after the machine is put together, thus preventing cracks, which would cause rust.

Being **absolutely germ-proof**, is the only perfect, sanitary washing machine in existence.

\$11.00 Upon receipt of Eleven Dollars, U. S. Gold (or its equivalent), we will crate, ready for steamer and deliver f.o.b. cars at New York City.

Protection for Bank Checks!

A device that insures bank checks and drafts from being raised or altered appeals to all good business concerns—conservative as well as progressive.

The laws of nearly all countries make it incumbent upon those issuing checks to surround them with every obtainable protection.

The Ingersoll Automatic Check Punch cuts the marks and figures into the check and on account of their peculiar design, they cannot be successfully altered. Guaranteed five years—lasts twenty.

Used and endorsed by leading banks and mercantile houses of the United States

Correspondence invited from houses able to distribute in quantities.

PRICE, \$25.00

LIBERAL DISCOUNTS TO THE TRADE.

HIGH-GRADE FIRE APPARATUSES.

**FIRE EXTINGUISHERS,
CHEMICAL ENGINES,
TRUCKS,**

**For Storehouses, Homes,
Factories, Establishments
or Fire Departments.**

Please pay us a visit when you come
to the Exposition in 1904.

When the apparatus is loaded it will throw a
stream of gas (which gas is the best fire extin-
guisher) at the distance of 50 feet. Any woman or
child can operate it as well as an expert man. It
is always charged and ready for use, but it has no

pressure until the moment of using. It can be used every day, lasting a lifetime.
Once discharged or used it can be charged again in one minute.

MANUFACTURERS OF

The Winget Concrete Building Block Machine,

Automatic, adjustable and rocking. To admit the facing of
blocks. Combining ten machines in one, for the manufacture
of concrete blocks for dwellings, factories, bridges, power
plants, docks, retaining walls, tunnels, subways, silos, founda-
tions, gutter blocks, wall copings, etc., etc.

SEND FOR OUR NEW CATALOGUE.

In order to facilitate our increasing export business, we
desire to establish an agency with one responsible firm in
each trade centre of the world.

We are erecting a building of our Concrete Blocks at the St. Louis World's Fair.
It is located just east of the Press Building and the Wireless Telegraph Steel Tower,
and north of the Liberal Arts Building. The public are invited to inspect the building.
One of our machines will be shown in operation there.

"IDEAL" Steam Cookers

FREE Book of 36 pages, printed in colors;
handsomely illustrated; tells all
there is to know about steam cookers—round
or square. The 1904 models of "Ideal" Steam
Cookers are entirely new in principle, design
and special features. The
only steam cookers made in
which both round and
square have whistles to
call the cook when water is
needed. Seamless copper
tank bottoms.
Cooks a whole meal
over one burner, on
gasoline, oil, gas or
common cook stove.
Reduces fuel bills one-
half. Agents wanted.

We Want Foreign Agents, and to get them quickly, we are making the
following liberal proposition for this month:

No. 20, Sq. Copper Tank
Retails \$6.50 Each.
13-gallon food capacity. 12
Cookers in a box. Measure-
ments and weights of boxes
holding 12:
Gross weight, 210 lbs.
Net weight, 144 lbs.
Cubic feet in 12—28.
\$39 doz., f. o. b. N. Y.

No. 6 Round Cooker
Retails \$5.00
10-gallon capacity. 12 Cook-
ers in a box, nested, solid.
Measurements and weights,
12 in a box:
Gross weight, 150 lbs.
Net weight, 120 lbs.
Cubic feet in 12—11 1/2.
\$33 doz., f. o. b. N. Y.

These are our best sell-
ers, but we make thirty
different sizes of Cook-
ers. Boxed ready for
steamer. Order direct
orthroughexport house;
in latter case, mail du-
plicate order to us to
avoid errors.

We manufacture a full line of Kitchen Specialties and Blue-Flame Wickless Oil Stoves.

Hutchison Acoustic Company, Astor Court Building, New York.
Cable Address, "Acousticon."

MASSACON PRICES.

Type A—In a very handsome case of quartered oak, mahogany or ebony, as may be desired. Has necessary controlling apparatus for use in connection with electric light, such as may be found in any city or town, and ALSO IN CONNECTION WITH BATTERY, when light circuit is not convenient.

Price, f. o. b. New York, weight 5 lbs., - \$100
Battery, extra, weight 34 lbs., - 12

Type B—This instrument is identically the same as Type A in finish, except it is arranged to be operated with a battery alone and cannot be used with an electric-light circuit.

Price, including battery, f. o. b. New York, weight 5 lbs., - \$90

Battery, extra, weight 24 lbs., - 10

Type D—This instrument is not provided with the attachments for use with an electric-light circuit, but is used with a battery only. Nicely polished oak case.

Price, including battery, f. o. b. New York, weight 4 lbs., - \$50

Battery, extra, weight 12 lbs., - 6

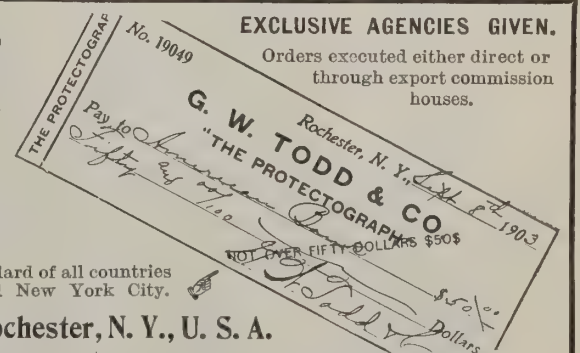

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is \$30, delivered New York City.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage.

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

The Glow Night Lamp.

A SCIENTIFIC WONDER

**200 HOURS' LIGHT
FOR ONE CENT.**

Makes and consumes its own gas, generated from kerosene oil. The only lamp using a glass burner.

**Absolutely Safe and Free
from Smoke or Odor.**

Catalogue and Price List sent on application. Patented in the United States, Gt. Britain, France and Austria.

Style 1.

Style 2.

THE GLOW NIGHT LAMP CO., Incorp., 73-75 PEARL ST., Boston, Mass, U.S.A.

A HATCHING WONDER

The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17 1/2 inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

CYCLE HATCHER CO., Salem, N. Y., U. S. A.

WANTED Agents to sell our Whale Art Embroidery Needles, which do elegant work on any woven goods, making beautiful raised figures of birds, animals, flowers and many useful articles to ornament the home. Any person can use it and do the work ten times faster than by hand. This is one of the easiest and most rapid money-making propositions in the market. Our agents are making rapid sales and big money wherever they offer the Needles. No experience is required to make a success. We furnish the outfit and full instructions with the first dozen Needles, so our agents are at once fully qualified to begin work and are assured of a handsome income. Send for a sample dozen Needles and terms on large quantities. We send sample dozen for \$2.70. Our \$3.00 White Rabbit Sofa Cushion and other samples of the work we furnish FREE to agents make it a pleasure to sell the Needles. **WHALE ART CO., 527 Bates St., St. Louis, Mo., U. S. A.**

Rings that are Guaranteed to give wearer Satisfaction

MADE OF ROLLED-GOLD SEAMLESS WIRE.

In order to introduce our lines we are prepared to send an assortment of our samples, 48 styles of our rings for \$10.00, U. S. Currency, which will give an idea of the excellent quality of our manufacture. Catalogue and price list on application. Orders executed direct or through any export commission house.

THE R. L. GRIFFITH & SON CO., Providence, R.I., U. S. A. Established 1879.

KEASEY WOOD SPLIT PULLEYS

with Malleable Iron Hubs are mechanically correct in design and construction. No slippage on the shaft. No wide paddle-like arms to fan the air and consume power. Be progressive and use a modern pulley. A half million already in daily use. Live machinery and supply dealers everywhere handle and carry them in stock. Catalog on request.

"FOR THOSE WHO WANT THE BEST."

Fiberlite Shade and Holder.

Shade made from fiber similar to that used for lining sockets. Mottled green on outside and pearl gray inside. Fiber finished under pressure which gives it a gloss finish, furnishing fine reflection for light. So tough that edges will not break and so springy that it cannot crush. Holder of heavy wire; one piece, clamps to socket with a catch. One catch and no screws. Fastens to inside of shade and any tendency to pull off only makes it hold more securely.

Light as aluminum shades, which means cheap freight rates.

TO INTRODUCE ABROAD:
Upon receipt of \$40.00 in U. S. gold or its equivalent, we will box and deliver f. o. b. cars at New York, five gross of these shades in assorted sizes.

Orders filled through commission houses. Correspondence solicited. Catalogue H on application.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

"THE SUN NEVER SETS UPON"

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
 2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
 3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
 4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
 5. The tub has a wringer box, fastened with steel brackets.
 6. The lid on tub closes tight, no escape of steam.
 7. Has guided hoops, castings and name.
- Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

Manufactured Exclusively by

H. F. BRAMMER MFG. CO.,
DAVENPORT IOWA, U. S. A.

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.

THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the Louisiana Purchase Exposition amount to something over 12,000,000 square feet, all of which is practically completed at this writing, and at least 95 per cent. of this work was done with the machines we bought from you. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

We take pleasure in stating that, in our estimation, your machine is far superior to anything on the market.

The cold-water paint used amounted to almost 400,000 pounds.

Respectfully yours, BUILDERS' CONTRACTING COMPANY.

SPECIAL OFFERS FOR EXPORT:

Hook's "Best" Pneumatic Painting Machine (twenty-five of which were used in painting the buildings of the Louisiana Purchase Exposition), equipped with 25 feet pneumatic hose, 8-foot extension rod, for reaching ceilings and overhead work, and two nozzles. Gross weight, 250 pounds. Net weight, 125 pounds. Size of box, 20½x19½x47 inches. **Price, each, \$25.00.**

Hook's "Best" Pneumatic Painting Machine.

Hardie's No. 7 Painting Machine comprises a patented brass pump with brass ball valves, ingenious agitator and paint mixer, contained in a 30-gallon barrel, mounted on wrought-iron wheels, 26 inches in diameter, with 1½-inch tires, and is as easy to wheel as a baby carriage. It is equipped with 10 feet of high-grade ½-inch hose, long extension rod and special disgorging painting nozzle. Will spray any liquid of a sprayable nature. Weight, 110 pounds. Packed in two cases—one 9 cubic feet, one 7 cubic feet. **Price, each, \$17.50.**

Hardie's No. 7 Painting Machine.

The prices above quoted (U. S. Gold) include packing and delivery at New York City.

THE "STAY-THERE" READY-MIXED COLD-WATER PAINT

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. It is as durable as oil paint; is fireproof, weatherproof, washable and sanitary.

SPECIAL OFFER FOR EXPORT.

Interior Paint (white), per ton of 2,000 pounds net, - - **\$30.00** Exterior Paint (white), per ton of 2,000 pounds net, - **\$50.00**
Packed in barrels weighing about 400 pounds, measuring 28 x 28 x 20½ inches. These prices are F. O. B. dock at New York City.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the Only machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

Lunkenheimer Automatic Brass Injector

FOR ALL CLASSES OF STEAM BOILERS.

Well designed, compact, efficient, durable, low-priced and reliable. In action it is easy to start, has large range of work, full capacity, is absolutely automatic and the discharge can be graded within wide limits. All parts are well proportioned, strong and durable, and any worn-out piece can be easily and quickly replaced at slight expense. Starts low at 22 lbs., works high to 185 lbs. Feed water 75°, lift 3 feet, works without adjustment of steam or water at pressure from 60 to 180 lbs. Automatically restarts if operation is temporarily interrupted. Tubes are easily removed for examination or repairs by the use of a simple wrench. Devoid of small parts which are easily lost or unreliable in action. 50 per cent. more durable than any other machine of its class. Retains original efficiency under constant usage, and slight wear on tubes will not impair its operation. Works well with hot feed water and on long lifts. Every injector subjected to rigid tests and carefully inspected before shipment.

Impartial tests solicited and satisfaction guaranteed. Specify LUNKENHEIMER Automatic Injectors and order from any leading export house. Write for catalog of Brass and Iron Steam Specialties and Engineering Appliances of superior quality.

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These lamps are made for outdoor or indoor use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills, workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals or a long, narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a blizzard globe, 1-inch wick and a bright tin reflector 12 inches in diameter. Price, \$30.00 dozen.

No. 60 has a No. 2 globe, 1 1/2-inch wick and a bright tin reflector 16 inches in diameter. Price, \$72.00 dozen.

We are pleased to send complete catalogues (Spanish or English) and price list to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2 3/4 turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

"THE SUN NEVER SETS UPON"

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
 2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
 3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
 4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
 5. The tub has a wringer box, fastened with steel brackets.
 6. The lid on tub closes tight, no escape of steam.
 7. Has gilded hoops, castings and name.
- Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

ONCE SOLD, THEY NEVER COME BACK.

Wood-Working

We make a complete line of machines for cutting wood, which we can furnish in single tools or entire outfits. Machinery in use all over the world, by governments, corporations and individuals.

Full particulars of any machines sent on demand. Catalogues in Spanish, French, German or English free. We correspond in Spanish, and invite correspondence about any machines for working wood you may feel interested in.

**Machinery.****No. 29. New Single Cylinder Planer.**

(Patented December 19, 1899; February 6, 1900.)

An entirely new planer containing many advantages for insuring good work. One of our most successful specialties is planing machines, and this is the newest and one of the very best. All users of planing machines should notice this point: the feeding-in roll is in sections, and each section is center-geared, so that two or more pieces of uneven thickness can be planed at the same time, and each receive an even pressure.

tank; 1,000 candle-power;
15 inches.

"1900" Washing Machine

AND ITS PARTS.

Interior view, showing clothes in process of washing.

Looking under Bottom of Washer.

Inside view of Tub and Bottom of Agitator.

Shows Washer with the tub removed from the frame and the agitator or disk which rests on the clothes and water during washing. It also shows the wringer in position as when in use.

"1900" Washer.

"Domestic" Washer.

"Home" Washer.

"1900 Junior" Washer.

"1900" Washer.

A Remarkable Record!!! Reward of Merit!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time "turned out" an average of Five Washers per day. During the month of August, 1903, we manufactured and sold OVER FOUR HUNDRED Washers per day.

A Remarkable Record!!! Reward of Merit!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment**, but by the adoption of our **agitator** tosses and tumbles the garment through a **whirlpool of water**, thus **forcing the water through the finest or coarsest fabrics**, causing the clothes to become **ABSOLUTELY CLEAN**, without boiling or scrubbing, without wear or tear, and without the use of chemicals.

Machines.

Special Offer for Foreign Markets Only:

\$22.75

Upon receipt of **Twenty-two Dollars and Seventy-five Cents** in U. S. gold, or its equivalent, we will box, ready for steamer, and deliver F. O. B. cars at New York City, **One of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-BEARING WASHING MACHINES.** Weight of the four machines, boxed, 340 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us a duplicate of order. Our Illustrated Catalogue mailed postpaid.

FOREIGN BUYERS OF AMERICAN GOODS
PROFIT BY LOW PRICES.

A PRESIDENTIAL campaign is in progress in the United States of America at the present time. It is of great importance to the inhabitants of this country, but the affairs of the nation are in such a prosperous condition and the domestic balance of trade is so well maintained that the result, whichever way it may go, cannot have any unfavorable effect upon the future of the country—either in a business or governmental way. Questions of politics are not open for discussion in these columns, but the campaign has brought out some facts of great interest to our foreign readers. Mr. Secretary Shaw, head of the United States Treasury Department, is one of the leaders of the dominant party and is in a position to know whereof he talks. In a recent speech he replied to the attacks of his political opponents which were based upon the assumption that domestic purchasers of American products could not buy them as cheaply, for the same quality, as could foreign customers of American manufacturers. It has often been pointed out in THE AMERICAN EXPORTER that our manufacturers do business upon a basis of moderate profits, quick sales and fair treatment of their customers. It is doubtless true that in the export trade some manufacturers are content with a slightly smaller percentage of profit, based upon a desire to offset in part the greater expense of delivery to world-wide distant points. In such cases the goods shipped are not only equal to the home standard, but our exporters would make the articles better if possible.

Taking these facts into consideration our foreign readers will be much interested in the following extracts from Mr. Secretary Shaw's speech:

"Our opponents lay much stress upon the fact that some American manufactures are sold abroad cheaper than at home. Our friends sometimes deny this, and they sometimes apologize for it, and a few in times past have joined our opponents in recommending a removal of the tariff from all such articles. It is useless to deny, and in my judgment unwise to apologize, and little short of foolishness to attempt to remedy, the assumed evil in the manner proposed by the opposition.

"A non-partisan commission, appointed by Congress to investigate the subject, with authority to compel the attendance of witnesses, reported that \$4,000,000 worth of merchandise, the product of American factories, is annually sold abroad cheaper than in the domestic market. The report shows that some of these articles are protected in this country by patents, and are not so protected in the foreign markets. If the supposed evil as applied to patented articles is worthy of drastic remedial measures the most feasible would be the repeal of patent laws.

"There is one other important feature not often recognized. The

Republican party has always provided a method whereby a manufacturer can have the benefit of free raw material for the production of merchandise actually exported. Under regulations prepared by the Secretary of the Treasury the consumer of imported material is allowed to recover the duty paid thereon whenever he exports the same or any article manufactured therefrom.

"During the fiscal year 1903, the amount of drawbacks thus actually recovered exceeded \$5,000,000. A portion of this was upon goods exported direct from warehouses, and upon which no labor had been expended. But if the Industrial Commission reported correctly, that only \$4,000,000 worth of merchandise is annually sold abroad cheaper than at home, then the annual drawback on imported material would seem to remove any presumption that an injustice is being perpetrated upon the American consumer. A very small portion of the \$5,000,000 drawback would cover the difference between the price at which this merchandise is sold abroad and the domestic price.

"We manufacture \$13,000,000,000 worth per annum. This industrial commission reported that an aggregate of \$4,000,000 per annum, or one thirtieth of 1 per cent. of the output of our factories, is sold abroad cheaper than at home. In other words, this non-partisan industrial commission, after spending months in taking testimony, reported that of every \$1,000 worth of manufactures produced by American labor 30 cents' worth is sold abroad cheaper than to our own people, or, stated in another form, every time \$700 is paid to labor employed in shop and factory, 30 cents' worth of goods, the product of this labor, is sold abroad for 29 cents.

"While our people complain of this practice, I think it defensible. But, whether defensible or not, I know that foreign producers do the same thing. Nearly every class of goods imported into this country is obtainable below the regular foreign market."

Mr. Secretary Shaw is a high authority upon this subject and his utterances are well worthy of attention, or we would not give them this prominence. Our foreign readers can study what he says with undoubted profit to themselves.

SOME of our Paris contemporaries do not take the American World's Fair now being held in this country in as serious a vein as the Exposition deserves, but this lack of appreciation is more than made up for by the high tributes which have been paid by M. Jusserand, the French Ambassador to the United States, in the official communications which he has sent to his government. One of the Paris editors declares that all the Exposition represents is a "lavish expenditure of American dollars without adequate artistic results." M. Jusserand maintains that the Exposition is exceptionally artistic and beautiful and as he has made an inspection of it his conclusion will be generally accepted as being in full accord with the facts. As a matter of current history it may be said that the American show at St. Louis has been characterized by competent observers, who have had the advantage of experience in attending such expositions, as being one of the most marvelous of the kind that they have ever seen.

CURRENCY for the new Republic of Panama is a question of international concern in which the United States takes particular interest from the fact that this country was instrumental in giving birth to its youthful sister republic. The Panama Government has wrestled with the problem without result and our authorities have been appealed to for aid and advice. It is probable that a financial system will be recommended and adopted which will substantially duplicate the features of the monetary plan which is in force in the Philippines; namely, the establishment of gold-dollar unit, with a silver peso of the value of half a dollar (50 cents) in gold as the common circulating medium. If this plan goes through it will prove much more satisfactory than anything else that has been suggested.

TYPEWRITERS of American manufacture show an export increase in sale of more than \$500,000 in the last reported ten months. Our typewriters are marvels of perfection and adaptability to all of the written languages.

OUR AGRICULTURAL IMPLEMENTS.

EXPORTS of agricultural implements from the United States to foreign countries amounted to \$25,000,000 in the fiscal year ending June 30th, being an increase of \$4,000,000 over last year and a gain of \$9,000,000 over the preceding year. The Department of Commerce in commenting upon the growth of this branch of our foreign commerce, says: "In no class of manufactures exported has the growth been more steady and persistent than in that of agricultural implements." This condition is very gratifying to THE AMERICAN EXPORTER, for the most successful concerns engaged in this trade have been in the habit of using our advertising columns to attract foreign patrons. On another page will be found some details of the increase and other information showing the distribution of our exports in this line.

Not everybody will realize what it means to add in a year \$4,000,000 worth of exports of American or any other nation's products of this kind as an excess to what was sold the year before. With American machines for farm purposes it means a great deal more than the ordinary reader will appreciate, for our manufacturers are producing farm implements that for proper weight, worth and utility are not excelled by any other manufacturers, while there is the added strong point of durability. Our agricultural implements are first made to be used; secondly to be sold. This reverses the usual order of business, but the concerns which advertise in this journal have acted upon that principle and have found that their honesty of purpose is appreciated by agriculturists throughout the world. It may soon be said that our agricultural implements are being made to be sold as well as to be used and perhaps later on the conditions will assume the normal aspect, but there will be no change in the excellent quality, nor will there be any diminution of the durability of the implements.

The concerns engaged in the manufacture of agricultural implements in the United States are controlled by gentlemen who take as much pride in the perfection of their products as they do in the profits which may come to them from making larger sales. They are honest men. They give to the farmer in South Africa, in Australia, in India, or anywhere else in the world, just as good a plow, thresher or other machine as they would furnish to their own neighbors, and at relatively the same price. The policy of this course would not appeal to any but progressive men, who realize that good implements last longer than defective ones, but that the user is likely to be possessed of proper intelligence to realize the fact—especially if he has had experience with goods that are cheap in price, but costly through defects.

FARM MACHINERY VS. THE FARM HAND.

AMERICAN farming machinery enjoys a deserved popularity throughout the world, but nowhere is it more appreciated than at home. It has been a matter of wonder in the minds of many people as to just where the manufacture of these implements would lead and as to whether the supply would not eventually become greater than the demand. The *Prairie Farmer*, in a recent discussion, has the following to say, which, while it does not solve the problem; furnishes suggestions for thought as to the possible growth of this country, at the same time mentioning some conditions with which some of our agricultural readers abroad are familiar:

"As the population increases and the available land that is open for homestead entry becomes less in quantity and quality, the natural inference would be that laborers on the farm would be more easily secured. But in spite of the above facts, and the additional one that nearly a million immigrants are coming to our shores annually, the cry for farm help becomes more and more insistent with each passing year. The farm help problem is one that cannot be settled by a series of fault-finding on either side. There are good farm hands to be had for their price, and there are many exceedingly poor ones, as we know from experience, that are dear at any price. There are not enough of the former to go around, and the latter are, doubtless, not solely to blame for the dissatisfaction that is so prevalent. There is also, perhaps; as wide a difference between employers as between employees. There is a way, however, of solving

this problem to a considerable extent, and this method is being adopted by the most progressive farmers. The method referred to is the use of improved farm machinery, which does away with a large part of the hired help necessary under older methods of farming.

"The hay harvest will soon be at hand, and it would be well to consider this problem in connection therewith immediately. Not only will machinery save much of the outlay that must otherwise be expended for hired help at haying time, but it will enable the hay to be put up in better condition so that it will have a greater feeding or market value. The loader will pitch hay as fast as several men, and will not go on a strike when the farmer gets a lot of hay ready to haul, as we have known hay harvest hands to do. With the loader he can run in a lot of hay quickly when a sudden rain appears. The sun never gets too hot for it to work, and it will do a much cleaner job in taking up the hay than will a man with a fork.

"Another implement that saves much time in the curing of hay, and which is of very great importance if the hay is at all heavy and the weather bad, is the tedder. A good shaking up and turning inside out by this implement after the top has dried will very greatly hasten the curing process, especially if the hay has been dragged into bunches or been run over by the mower after being cut. This will often mean the difference between having the hay very much damaged by being caught in a rain when partly cured and being able to get it cured and under cover before the rain comes. It is not advisable for the farmer to buy every new machine that comes out without due consideration of its adaptability to his needs, but he should keep himself informed regarding new machinery and study its adaptability, for herein lies, to a considerable extent, the solution of the farm labor problem. Another feature, and one that will appeal especially to the housewife, is that more machinery and less hired help means much less work in the house."

Agriculturists in other lands will find it advantageous to follow the example of our farmers and place their faith in American farm implements.

ELSEWHERE in this issue we print some facts about the steady growth of our export trade with Canada. Regardless of discrimination against us in favor of the United Kingdom, and despite the establishment of manufactories by our own people in the Dominion for the making of American products, it seems that nothing can check the Canadian demand for our manufactured goods. As we have before remarked, the inhabitants of Canada are good judges of values, both as to quality and quantity and they thoroughly appreciate the worth of our manufactured articles.

DESPITE all the bad things that some sensational papers have had to print about the United States Steel Corporation, it appears that the net earnings for the last quarter will be about \$18,000,000. We would not refer to such dreams as some of these papers have printed about the trust. Its affairs have been adjusted upon a basis of supply and demand with a profit and benefit to all of the interests involved.

WE do not like to print statistics and we do not care very much for them at any time, but an esteemed correspondent, Walter J. Ballard, has sent us some figures which show so graphically the progress made by the United States in the last forty years that we have concluded to print his letter. Mr. Ballard uses a lot of figures, but he puts the results in such shape that "those who run may read." His summary is a chart of American progress.

INVENTORS in America have organized a trade union. It is called the Inventors' League, and its purpose is to protect inventors and enable them to put their inventions on the market. The union is unique, but it is nevertheless a progressive step, for many inventions of importance have waited for long periods before their merits have been recognized.

LIQUID AIR'S PRACTICAL USE.

WHAT commercial wonder will come next? Scanning the horizon of invention we believe that liquid air is more likely than anything else to come into general use as a necessity of life, particularly in the tropics and during the heated periods which are seasonable in the temperature zones. Refrigeration and the manufacture of artificial ice have made such strides within the last few years that they have long since gone beyond the experimental stage. Liquid air is by no means new, but its use has been almost entirely experimental up to the present time. It has been a toy, but it promises now to become a wonderful adjunct to human comfort everywhere in the world. There is every indication that the practical application of this wonderful product will go so far as to provide for its daily delivery to offices and households, just as ice, milk, bread, newspapers and other necessities are now delivered in the large cities. It is now reported that some American inventors have perfected their systems to the extent that they are building a plant which will manufacture every twenty-four hours liquid air which in cooling effect will be equivalent to two hundred tons of ice. At first they propose to interest large establishments where the liquid air will be delivered ready for use, at one-twentieth of the present cost. Later, when its value is recognized, it will be delivered to the houses in insulated containers ready to attach to the pipes leading to a coil overhead. This coil, by the way, will be made as ornamental and inconspicuous as possible, and will cost no more than steam or other heating pipes. As nitrogen is one of the most perfect preservatives known, it is predicted that when it becomes plentiful through the manufacture of liquid air, it will be possible to do away with ice, so far as the kitchen refrigerator is concerned. There are other uses to which liquid air can be put, in the matter of refrigerating, which will readily occur to our readers in tropical climates.

The problem of heating buildings and dwellings during cold weather was solved long ago, but there has never yet been something cheap to produce cool air that would be to the small user in summer an equivalent to fuel in the winter. In the matter of cooling theaters and other large buildings American inventors have devised systems of ventilating and cooling the air which leave nothing to be desired, but the plants required for the purpose are now beyond the limit of the means of the occupants of smaller buildings. Electric fans are excellent in their way, but they do not do much more than agitate the air. No doubt the present efforts at practical progress in the liquid air industry will not only result in furnishing a valuable auxiliary to the present American systems of ventilating and cooling large buildings, but will enable farmers in bucolic districts and householders in cities to acquire the means of cooling their rooms without going to any great expense. Our readers will be duly advised of further developments in the direction of using liquid air for this or any other purpose.

THE UNION AND THE DOMINION.

MIGRATION between the Dominion of Canada and the United States is constantly in progress. Until within recent years the influx of Canadians into the United States has been larger than the outgo of Americans into the Dominion, but now it seems to be upon an equal balance. American firms have established branch factories and a considerable proportion of their help has gone from this country into the friendly territory of our Northern neighbor, in addition to the agriculturists who have been attracted by the homestead privileges which are given by the Dominion to new settlers. The great area of the United States still contains some large unsettled tracts, but these are by no means as attractive to some of our ambitious Americans as are the vast wildernesses of good, cultivatable land which have been left undeveloped in Canada. That the Dominion is making progress in the settlement direction is shown by the figures for the last two years. The number of homesteaders in 1902 was 22,215, who are said to represent 64,968 persons; in 1903 the number was 32,682, representing 90,455 persons. This gain shows that real progress is being made. Meanwhile the great American cities are attracting thousands of bright Canadians, and it is noteworthy that they invariably become quickly imbued

with the onward and upward spirit of the country, making valuable additions to our business world and assuming the duties of citizenship with a vigor born of the vitality of their northern nativity. On the other hand, the Americans who take up their homesteads in Canada are men of the kind who could not, if they would, lose one whit of their faith in American institutions and whose advent into Canada can only cause a greater feeling of friendliness to permeate the relations between the two great English-speaking nations of the North American hemisphere.

The increase in this migration is becoming so noticeable that it is attracting general attention and the trend of sentiment is that the constant exchange of population is making for a closer relationship between the Dominion and the Union—as the United States is called colloquially. We have pointed out in previous issues of THE AMERICAN EXPORTER that closer commercial relations, if not political, are inevitable; but we have maintained that many years must elapse before there can be any serious thought of a union of government. The United States has no desire to abduct one of Great Britain's fair daughters, although this country could hardly refuse protection to such a charming young lady if she were to plead to be annexed. The latter contingency may never happen, although there are devout wishers on both sides of the boundary line. For present purposes we are fully satisfied with the good results to trade and commerce which will ensue from the mixing of the two populations and from the agricultural development of the vast territory which borders upon our own broad expanse of cultivated acreage.

PROBABLY the most important invention which came to public notice last month in America was that of Professor Pupin, of Columbia University, New York City. Dr. Pupin's discovery will not exactly revolutionize things, but it will prove of great importance in reducing the cost of operation of telegraph lines and will therefore cheapen the expense of sending telegraph messages. Anything in this direction is of practical benefit to commerce everywhere, and the description of the discovery published elsewhere in this issue will be read with interest throughout the world.

WE have many times had occasion to refer to the friendliness of the Emperor of Germany toward America and Americans and an account taken from *Leslie's Weekly*, showing how he rebuked some anti-Americans who snubbed the United States Ambassador, gives such a good idea of the real German-American feeling that it is printed elsewhere for the information of our readers in other countries. The action of the Kaiser was thoroughly characteristic of him and no doubt our Berlin friends are sorry that they undertook to slight the American ambassador.

PIG-IRON imports into the United States in the month of May represented but 1,935 tons, while the imports of foreign pig iron, scrap iron, old iron rails, structural iron, steel billets, steel brooms, steel wire rods, scrap steel and old steel rails, which during some months within the past two years have aggregated close on to 100,000 tons, fell to 3,976 tons in May. This great change is due to the increased demand for the exportable products among those mentioned.

CURIOUS stories come from Poldhu, in Cornwall, to the effect that the neighbors of Signor Marconi have come to the conclusion that his wireless telegraph station is a hoodoo. A protracted period of unusually bad weather was attributed by the residents to the work of the wizard of wireless communication. It is fortunate for Marconi that he lives in the present age of progress; his fate not so very many centuries ago would be too awful to call for present discussion of the tortures which might have been applied to him.

ONE interesting feature of our trade with Canada is that the agricultural implement shipments in 1903 were eight times those of 1897, when the first preferential duties went into effect.

THE FAR EAST WAR AND TRADE.

OPERATIONS of considerable importance have been in progress during the last month in the war between Japan and Russia, but the cabled reports have been unsatisfactory and contradictory. The armed conflict, judging by the latest indications, promises to be more protracted and certainly much more sanguinary than the diplomatic negotiations which were preliminary to the war. There is no new feature of the affray itself calling for comment, nor has any sufficiently positive advantage been gained by either country to make it certain which one will prove victorious. Meanwhile the trend of trade toward the Far East takes on a different aspect. It does not seem to decrease, but with almost everything included in the list of contrabands of war, traders engaged in supplying either country with what they chiefly want in the present emergency are living upon doubt and expectation, although not to such an extent as would be the case if Russia had been more fortunate in controlling the sea on the Asiatic coast or if Japan could have offered effective blockade opposition to the importation into Russia in Europe of anything that the Czar's government or subjects might desire to purchase.

Of chief interest to persons engaged in international commerce is the extension of the list of contrabands of war which may be confiscated. One of the incidents of the month was the seizure of a British vessel, but prompt release followed. It is unlikely that either Russia or Japan will try to enforce the war regulations regarding contraband in a way that will involve any other country in the fight that is now in progress. It is some satisfaction to know that the war is apparently likely to be limited to the two Powers now engaged in struggling for supremacy in the Far East, for neither one seems disposed to provoke hostility of any of the neutral powers.

ARTIFICIAL FUEL'S FUTURE.

FROM time to time we have printed accounts of the invention of artificial fuel, a subject in which our foreign readers seem to be much interested, judging by the number of inquiries which we receive from them relating to the matter. Although more than six hundred patents have been granted in the United States to inventors of artificial fuel, and despite the fact that some of the discoveries have been shown by practical tests to be commercially profitable, there does not appear to be the eager rush for the new commodity that might reasonably be expected. This condition is one of the curiosities of modern American development. It is undeniable that the artificial fuel inventors are either slightly behind in the general progress of the age or that they are somewhat ahead of the times in which we live. Either reason would satisfactorily account for the slowness of manufacturers and others in taking advantage of the new artificial fuels, as far as the ordinary observer might be interested.

Without deciding this mooted question it may be said that American inventors and manufacturers have done so much in the way of perfecting their machinery that discoveries of this nature do not attract so much interest as one would ordinarily expect. Cheaper fuel would naturally attract the smaller firms before it would the larger concerns, as the latter make contracts for fuel supplies covering years of time. The smaller firms, however, particularly in cities, do not use fuel direct to any great extent. The perfection attained by American gas, gasoline and hot-air engines, the serviceability of water-pressure motors and of electric motors, to say nothing of the systems which supply steam, the same as gas or water, in some of our large cities, has caused the millions of users of the various sources of power mentioned to depend upon the steam, gas or water that comes through the pipes, or the electricity that comes by wire, to maintain their power machines. There are in New York thousands of manufacturing plants, creating millions of horse-power daily, that never have an ounce of fuel carried into their big establishments. It is a condition that is difficult for persons unfamiliar with our conditions to fully appreciate.

The gas, steam and electric companies use hundreds of thousands of tons of fuel every week to create the products which they supply;

whether for light or heat or power is immaterial. The managers will unquestionably take up artificial fuel when it is shown that its use will tend toward economy, but even then the companies cannot do it until the artificial fuel makers are able to supply the enormous quantities of their product that would be required to feed the capacious furnaces that are kept going every hour of the year. The problem of the introduction of artificial fuel commercially will now be seen to be a greater one than the mere invention of the fuel.

More than a year ago we printed an account of a splendid test of artificial fuel upon an American railroad. The success of the test fully established the worth of the fuel and the railroad could have effected a great saving by adopting it and putting it into general use in its locomotives. The railroad managers were willing enough to do so, but the problem of feeding a thousand locomotives was at that time far beyond the capacity of the inventor. The same condition has been experienced by others. Some of the big railroads own their own coal mines; artificial fuel would scarcely attract the serious attention of the managers of these corporations.

We have not gone into this subject as extensively as we could for the reason that it will interest only a small share of our readers, but we have said enough to show those who are concerned that the inventors of artificial fuel will have considerable difficulty in soon securing profitable recognition. They seem to have brought their ideas to maturity at a bad time, for on the intrinsic merits of some of the new fuels they would have made great hits four or five years ago, but they have a chance of making up for lost time before the end of the decade which has now half passed into history. In accordance with our custom we will keep our readers advised regarding any developments in the artificial fuel industry.

FLAG follows the citizen is a principle of the governing power of the United States that found full exemplification in the recent release of Ion Perdicaris who was held in captivity by bandits in Morocco. The action of our Government in sending our warships to Tangiers involved no excessive display of valor, nor could it be construed as a demonstration of hostility toward our friends upon the borders of the Mediterranean. It was simply an illustration of the promptness of Americans to take an interest in turning wrong into right, even where our own might could only have moral effect. The French Government is entitled to equal credit for its promptness to act in this case of misadventure in one of its outlying possessions.

IN contrast with the strife in the Far East was the scene at Kiel last month when King Edward and Emperor William talked of the peace that makes for progress in Europe and tends to the advancement of international trade and commerce.

JAPAN'S trade with the United States seems to be increasing despite the war, and American Government reports show a gratifying increase despite the conflict in the Far East.

MEXICO is buying American locomotives more extensively than ever. These machines are like all others of our manufacture. They stand the test.

Our Boots and Shoes in Switzerland.—Horace Lee Washington, United States Consul at Geneva, says: "American boots and shoes are increasing in favor. I am convinced that if one of our larger manufacturers would open a store here and in other large cities in Switzerland and sell directly from factory to buyer, as is done in so many instances at home, it would be a successful venture."

American Trolleys in Western Australia.—American equipment will be used in the construction of municipal electric light and traction systems in Fremantle and East Fremantle, Western Australia. The initial installation will cost about \$500,000, and the work is expected to be completed inside of eighteen months.

Our Threshers Abroad.—"A few years ago you couldn't give an American threshing-machine away in many foreign countries, but now they are outstripping the European makes. South America has just begun to realize that we can skin everybody else in machinery of all kinds."—*The American Thresherman*.

SOME WORLD'S FAIR WONDERS.

Interesting Features of the Machinery Exhibit at the American Exposition.

A BIRD'S-EYE view of some of the attractions of the American World's Fair, now in progress at St. Louis, will prove of interest to such of our readers as may not be able to visit this wonderful exposition. For many of them the Palace of Machinery would be the chief attraction. Never has the world seen such an assemblage of machines, never such an installation of power generators. With one glance the visitor may see in operation machines which develop power equal to that of over 50,000 horses, all pulling together. This palace is but one of the thousand structures that make up this greatest of world's expositions. There are more than twenty important exhibit buildings.

The Palace of Agriculture covers twenty acres, the equivalent of a farm under roof. You can walk up and down aisles for miles without recrossing your path and learn a new lesson about agriculture with every step. Other buildings range from eight to fifteen acres each. The four pavilions of the Palace of Art contain a total of 135 galleries, in which will be found the art treasures of every country of the world in which art has made creditable progress.

The Palace of Transportation contains the automobile display, the automobile boats of high speed and other marine craft. The railway display has four miles of display tracks within the building. A monster locomotive with drivers flying at eighty miles an hour occupies a movable turntable in the center of the building.

Two buildings of fourteen acres each are given up to manufactures. The United States Government has an imposing palace on a hillside. It is 800 feet long and is filled with departmental exhibits. A half section of a man-of-war is one of the many features. The Government Indian exhibit and fisheries exhibit occupy other buildings. Many acres are occupied with outdoor exhibits.

Fifty nations of the world and fifty States and Territories of the United States are active participants in the great exposition. Magnificent buildings on every hand give outward expression of their presence, and in many palaces are the displays of natural and manufactured products from lands far and near.

It but mildly tells the story when one says the Pike (or Midway) is more than a mile long, for in that measured length are immeasurable possibilities for pleasure of most novel kind. There are trips to the most wonderful places and back again in a twinkling. There are delightful mysteries and thrilling scenes, villages and streets from many nations, scientific wonders and spectacular shows.

But the reader would like to go back to the Palace of Machinery and the power plant. Alluring things are everywhere, but the power plant is a marvelous thing if we but study its details. The palace is 1,000 feet long and 500 feet wide. It covers ten acres. The power generators are in the western part of the building and receive their steam from a huge boiler plant in another great building near by. These engines require the equivalent of 400 tons of coal per day to supply the steam.

The public has never seen a steam turbine, the dream of mechanics since the first application of the force of steam. The dream has come true. Thought and experiment have won at last the success that has baffled many an inventor now dead. So recent is the invention of the successful steam turbine that no exposition has before offered an opportunity for its public display. At the World's Fair in St. Louis can be seen, not one, but three, types of successful steam turbines, all related, yet as inventions quite distinct.

When steam is released under pressure of 150 pounds to the square inch in the ordinary atmosphere, it has a velocity of nearly 3,000 feet—almost three-fifths of a mile—per second. Projectiles from big cannon or Mauser rifles do not travel so fast. When steam under the same pressure is released into vacuum the velocity is over 4,000 feet per second. Here was the basic idea. To release live steam at such tremendous velocity against revolving parts of small diameter would now seem the height of folly, but inventors for nearly a hundred years hadn't thought so. Waste of energy and efficiency could be the only result. How easy to see it now!

Three inventors share the honor of making a successful steam turbine. They are entitled to a place in a list of honored names—Carl de Laval, of Sweden; the Hon. Charles Algernon Parsons, of England; C. G. Curtis, of New York. Three countries share the distinction, and it is better thus, for this is no narrow world.

In the De Laval turbine the steam is discharged from the boiler through an expanding nozzle upon a set of vanes upon a single wheel. Good efficiency is secured, but the rotation of the wheel is so swift that its velocity is reduced ten to one before it is applicable to power uses. This is done by means of spiral-cut gears.

The Parsons turbine is the one which is now in practical use on the English Channel propelling the steamer Queen, a vessel 310 feet long, at twenty-three knots per hour. In the Parsons turbine the steam is carried between a succession of internal revolving cylinders and external stationary cylinder. Both the internal and external surfaces of these cylinders are equipped with circles of vanes and blades, so arranged that the steam passes alternately through rows of moving and stationary blades. The impact of the steam is deflected from the stationary to the moving blades and imparts the movement to the cylinders fixed upon the shaft. The turbine engines take

but little space, as compared with ordinary engines, and the noise is like that of a rapid-running dynamo. The absence of the unpleasant vibrations common to steamers having a reciprocating engine is at once noticeable. The Parsons turbine exhibited at the World's Fair is a 5,000-horse-power engine.

In the Curtis turbine the inventor has profited by the experience of his predecessors. The first patent by Mr. Curtis for the protection of his ideas in the construction of the steam turbine was issued nine years ago—in 1895. The development has been going on since that time. The engine for the World's Fair power plant is an 8,000-horse-power turbine, with an electric generator direct attached, the most powerful engine ever built for any purpose, and is guaranteed to deliver as high as 12,000 horse-power, or the equivalent of the entire amount of power used at the Columbian Exposition at Chicago ten years ago.

The construction of the Curtis turbine is, in some respects, similar to that of the Parsons, with the very important difference that the inventor has vastly enlarged the diameter of the revolving parts. The revolving mechanism of the Curtis engine consists of a series of disks strung upon a shaft. These disks alternate with fixed disks attached to the inner surface of the cylinder in which the parts revolve. The steam is admitted through a series of expanding nozzles around the entire circumference of the revolving disks. There may be as many blade disks as necessary to use almost the entire efficiency of the steam. As no oil enters the steam chamber the condensed steam is in a condition to be returned immediately to the boiler.

Aside from the Curtis turbine, the largest engine in the 50,000-horse-power plant is the Ellis-Chalmers reciprocating engine of 5,000 horse-power, valued at \$150,000. One needs to recall the great Corliss engine which attracted such world-wide attention at the Philadelphia Centennial Exposition. That ponderous engine never developed to exceed 300 horse-power. The Allis-Chalmers engine is equivalent to nearly eighteen of the Corliss generators. The construction of this largest of reciprocating engines differs from those familiar to most eyes, in the fact that it is both a vertical and a horizontal engine, having two pistons acting upon the same crank.

Other noteworthy engines in the great power plant are a 1,750-horse-power engine from Tedel, Germany; a 600-horse-power, high-speed engine from Harrisburg, U. S. A.; a 750-horse-power, medium-speed steam engine from Cincinnati, U. S. A.; a 1,000-horse-power slow-speed steam engine from Burlington, U. S. A.; four 3,000-horse-power reciprocating steam engines, with generators, from Pittsburg, U. S. A.; three 80-horse-power exciter sets, and many other engines of smaller rating.

The Steam, Gas and Fuels Building is a fireproof structure 330 feet long by 300 feet wide, a short distance west of the Palace of Machinery. A tunnel 17 feet broad by 8 feet deep connects the two buildings. One of the steam pipes conveying steam to the engines of the power plant is 18 inches in diameter; another is 16 inches, and none less than 10 inches. The many boilers in the building when at full load will evaporate 700,000 pounds of water per hour, or 350 tons. Huge condensers will change it again to water, when it will be returned to the boilers. The great power developed here is to be used in the operation of the electric railway within the grounds, the pumping of water and the illumination of the grounds and buildings. The value of the exhibits in the Palace of Machinery alone will exceed \$8,000,000, while the cost of the Exposition, exclusive of exhibits, is estimated at \$50,000,000.

Some Japanese Are in America to Learn.

AN incident at the American World's Fair last month shows that the Japanese are here to learn—and are evidently learning. The representative of the Imperial Railroad of Japan went through the Transportation Building the other day. He stopped at an exhibit of an American manufacturer of car wheels.

"Japan uses cast-iron wheels, the same as you do here," volunteered the Oriental, "although the majority of foreign countries forbid cast-iron wheels."

"You are safe," remarked the man in charge of the exhibit.

"I should like to have a sample of your car wheels," said the Japanese.

"Why, certainly," remarked the man.

"If it is not too much bother I would also like the formula of the mixture for these wheels," remarked the Japanese, casually.

"Oh, we can't give you that," returned the man with a laugh.

The official smiled and went away, and the next day he showed up again.

"We can't duplicate your wheels in our country," declared the Japanese railroad man, "for you make your wheels with Missouri iron. We might import your iron, but that would cost as much as to buy your wheels and have them shipped to us."

"How do you know all that?" demanded the exhibitor.

"I analyzed the sample you gave me," answered the Japanese.

Need of Care on the Part of Purchasers.—The *American Woodworker* says: "If purchasers would take greater care in setting new machines and observe more carefully the directions of the machine builders, there would be fewer 'kicks' to the builders and fewer sore spots among purchasers." This applies to the whole world. Good machines may sometimes not do the work expected of them through carelessness in putting them up. American machinery is built with due allowance for such carelessness, but, like that made anywhere, it gives the best results when properly treated.

Our Agricultural Machines in South Africa.

IRA A. SNYDER sends to the *Farm Implement News* from Port Elizabeth, South Africa, an interesting letter regarding the implement exhibition and plowing match recently held there, from which these extracts are made: "Notwithstanding the fact that the British implement manufacturers monopolize the trade papers in proclaiming the adaptability of their goods to the colonial trade and work on the patriotic sentiment of the dealers, the agricultural show at this place, April 7th and 8th, would have been a failure had it not been for the progressive firms who exhibited American machines in a manner which would have made the manufacturers feel proud of them.

"A large structural steel machinery shed about 500 feet long was filled to overflowing with implements of the smaller class, such as plows, pumps, feed-cutters, corn-shellers, grinding-mills, etc., and in some instances a large variety was exhibited outside. Hay-presses and windmills were much in evidence, and practically all were of American make. They were in operation.

"Windmills, fifteen in number, were clustered around a large reservoir and pumped water into it in streams varying in size from a candlestick to a water-main. This exhibit was unique and attractive. The dealers deserve great praise for their efforts in this line, as the exhibition is generally conceded to have been the most instructive display of wind-engines ever given in South Africa.

"Most of the dealers here are very progressive and readily adopt new ideas to suit the needs of the farmers. This was especially noticeable in the exhibition of disk plows and the predominating display of soft-center flint-steel plows, which the European manufacturers fail to produce in any creditable quality. One firm exhibited seed-drills and found a ready sale for them. However, most of the dealers do not understand the value of seed-drilling machinery. They believe the country is not sufficiently developed for the use of same, but the colonial farmer takes readily to labor-saving machinery, and its value need only be demonstrated to him, and he buys then and there.

"The one thing lacking in the show was a good exhibition of threshing-machines. Several cumbersome English outfits were shown, but the American thresher of the same size has double the capacity and is much easier to repair on account of the parts being readily duplicated. Perhaps the cause of the small demand for American engines here is that the people do not understand our high-pressure boilers. It is reported in various sections that the Government inspectors are condemning them as unsafe. Instances are reported where American boilers were limited to 110 pounds pressure. The work required 140 pounds and the boilers were guaranteed by the manufacturers to stand 200 pounds. Such discriminations will eventually lead to a test and prove either the inefficiency of the inspectors or a scheme not altogether honorable."

Our Agricultural Implement Exports.

AMERICA'S exports of agricultural implements have made satisfactory progress. Our implements have contributed to the development of the world's agricultural districts more than ever before in the last two years. In the American official fiscal year ended June 30th a gain of \$9,000,000 worth was reported, with a total of exports in this line for the year of \$25,000,000. That sum will buy a great quantity of plows, thrashing-machines and other implements used for tilling the soil. As American manufacturers figure on making their products durable, as well as reasonable in price, this big sum means practically new business. The implements sold one, two or three years ago, perhaps longer, are still in active use. Some facts about the growth and present trend of the trade are interesting.

The earliest year in which the value of agricultural implements exported was of sufficient importance to justify a separate statement was 1864. In that year the total value of agricultural implements exported was \$611,152. In 1870 the total was \$1,000,000, speaking in round figures; in 1880, \$2,500,000; in 1890, \$3,750,000; in 1900, \$16,000,000. Comparing this year's exports with those of a decade earlier, the figures in 1904 are practically five times as great as in 1894, the total for 1894 being \$5,027,915.

Comparing the growth in exports of agricultural implements with that in other articles during the same period, it may be said that cars and carriages have increased from 3 1-3 million dollars in 1894 to a probable \$12,000,000 in 1904; chemicals, from nearly \$7,500,000 in 1894 to a probable \$14,500,000 in 1904; scientific instruments, from \$1,500,000 in 1894 to \$8,000,000 in 1904, and manufactures of leather, from \$14,000,000 in 1894 to approximately \$33,000,000 in 1904, while agricultural implements have increased from \$5,000,000 in 1894 to a probable \$25,000,000 in 1904.

The principal foreign markets for American agricultural implements are shown in a table just prepared by the Department of Commerce and Labor, through its bureau of statistics. It shows that of the \$19,000,000 worth of agricultural implements exported from the United States during the ten months, for which detailed figures are available, nearly \$10,000,000 went to Europe, \$4,000,000 to South America, \$3,000,000 to North America, \$1,500,000 to Asia and Oceania, and a little over \$500,000 worth to Africa.

Considering the exports by specific countries, Argentina is, in 1904, the largest customer, the exports thereto in the ten months of 1904 being \$3,592,010, against \$2,500,000 in the same months of the preceding year, and \$1,750,000 in the corresponding months of 1902. Next in magnitude is Russia, our exports to that country in the ten months ending with April, 1904, being valued at \$3,133,442, a decrease of about \$300,000, as compared with the corresponding period of last year. France stands third, the exports of agricul-

tural implements to that country in the ten months under consideration being \$2,513,061, an increase of nearly \$500,000 over the same months of 1903.

The other countries to which the exports of agricultural implements reached a total of \$1,000,000 or upward in the ten months' period are, in the order named: United Kingdom, \$1,383,978; Germany, \$1,245,233, and British Australasia, \$1,226,271, each of these countries showing a substantial increase over the exportations of last year.

Mowers and reapers contribute about one-half of the total exportations of agricultural implements from the United States, while plows and cultivators supply about one-sixth of the total, the remainder being made up of miscellaneous tools and implements grouped under the general term, "all other agricultural implements and parts of."

Exports of mowers and reapers have steadily increased, having grown from \$2,372,638 in 1892 to \$8,818,370 in 1902, \$10,326,641 in 1903, and in the fiscal year 1904 will amount to about \$13,000,000. Exports of plows and cultivators have also rapidly increased, having grown from \$397,735 in value in 1892 to \$2,791,092 in 1902 and \$3,169,961 in 1903, and will be fully \$3,500,000 during the present year.

Other agricultural implements have increased from \$1,024,310 in 1892 to \$4,677,278 in 1902, \$7,510,020 in 1903, and a probable \$8,500,000 in 1904.

Our Growing Foreign Implement Trade.

THE popularity of American agricultural implements in foreign countries continues unabated. Exports are constantly increasing, not only to countries which admit American machines on equal terms with others, but to those which impose higher tariffs on our implements. There is, of course, no doubt that the exports to countries which have discriminating tariffs would be much larger if American machines were admitted on the same basis with others, but the fact that our exports are increasing to such countries, in spite of the tariff, is the strongest possible testimony in favor of the machines.

During the first eight months of the fiscal year there was a gain of \$2,500,000 in the exports of implements, and during the first two months of the calendar year of 1904 there was an increase of \$500,000. It is worthy of note that the shipments of mowers and reapers constitute a smaller percentage of the total than ever before. In the first eight months of the fiscal year of 1902 mowers and reapers constituted 52½ per cent.; plows and cultivators, 17½ per cent., and all others, 30 per cent. of the total. This year mowers and reapers constitute only 42 per cent., while plows and cultivators have increased to 19 per cent., and all others to 39 per cent.

The shipments to British North America show a decline of about \$300,000 during the eight-months period, as compared with last year. This decline was not unexpected, since so many United States manufacturing concerns have established branch plants over the line and are supplying their Canadian trade to a large extent from these establishments. One of the most remarkable features of the last official report is the increase in the exports to Argentina, amounting to \$1,200,000, a gain of 50 per cent. over the same period of last year.—*Farm Implement News*.

Chances for Cotton-Growing in Australia.

UNITED STATES CONSUL GODING, at Newcastle, New South Wales, recently made a report, from which these extracts are taken:

"The question has frequently been asked, 'Can cotton be grown at a profit in Australia?' Cotton-growing was a success in Queensland, in 1867-1872, in East and West Morton and the region of all the tributary rivers emptying into Morton Bay. At the height of the cotton industry in Queensland—about 1870—the area under cultivation was very large, the export of the product reaching 4,000 bales.

"In New South Wales, in 1898-1899, the cotton expert of the State made some experiments in cotton-growing on the State experimental farm at Moonbi, 200 miles north of Newcastle, where two acres were planted in cotton. The growing season was one not only of extraordinary drought, but of high winds during the first three months of the crop year. Upland cultivated crops throughout the district were entire failures, with very few exceptions, yet the cotton under cultivation held its own with lucern in remaining green and continued to grow when all other vegetation was at a standstill. This experiment satisfied the expert that lint cotton of excellent type and quality may be grown in New South Wales."

With the use of American machinery for the cultivation of cotton it is evident that the industry could be made one of importance to Australia.

American Wagons in the Far East.—An order for 1,000 army wagons for the Russian military service in the Far East has just been filled by a Minnesota (U. S. A.) factory. Most of the vehicles were of the new six-wheel type, built to carry five tons, and equipped with a brake crank, whereby soldiers may, in a hilly country, stop the heavy wagons almost instantly on a down grade.

Our Trade in the Dominican Republic.—Minister W. F. Powell writes from Santo Domingo that importations from the United States into the Republic have increased more than 25 per cent. during the past ten years in certain classes of textile goods. Americans have almost complete control of the market for shoes, having supplanted the French in the sale of this article.

A MASTERFUL AMERICAN.

Something About George Westinghouse, Whose Enterprises Are International in Scope.

WHILE some other American inventors have held the center of the stage of publicity it has been left to Arthur Warren, an accomplished writer upon industrial and other subjects, to paint a pen picture of an American whose enterprises are international. George Westinghouse is one of the modest men of our country. He is a man who *does* things, but does not talk about his achievements. From Mr. Warren's story in the *New York Times* these extracts are made:

"A big man, with 100,000 horse-power inside him; a masterful man, with 25,000 men directly under his leadership; a man who controls whatever he touches; an absolute ruler, as absolute as the Czar. George Westinghouse is a trained engineer, an inventor, a manufacturer and a financier. The combination is unique.

"Other men have won high places in commerce and industry, have been, and are, great forces. But they have not worked in his single-handed fashion. They have had strong partners, they have surrounded themselves with men of money. But this man has no partners, and you do not hear his name associated with groups of assistant multimillionaires. He stands apart like a tower that draws all attention to itself by its altitude, its proportions and position.

"All his interests, it is true, are in company form, incorporated; but he controls the companies and his word is the law that governs their energies. These organizations afford the most conspicuous example of one-man power in the industrial world to-day. They are not American enterprises only; they are international. There are nine manufacturing companies of his in the United States, one in Canada and five in Europe—two of the latter being in England, one in France, one in Germany and one in Russia. In New York there is also a great company of contracting engineers. In Pittsburg there is a financial company, and in London another. The manufacturing companies divide the world between them as the market for their output. In every considerable city you will find their officers or their agents. This business system is imperial in plan and operation. It is a world-encircling empire with an absolute monarch at its head.

"Stephenson taught us how to move a railway train; Westinghouse taught us how to control its movements, and he made modern railway traffic possible. We could not travel at the speed we do, nor operate the long and heavy trains, without being able to regulate their movements perfectly and instantly. The Westinghouse brake is the device by which the end is gained. Wherever there are railways you will find this brake."

The air-brake invention has been known for so long a time that one encounters many persons who think it must have been invented by this man's father. But the inventor was none other than the renowned American, who is to-day at the height of his activities, 58 or 59 years young.

In 1885 or 1886 our masterful American organized the Westinghouse Electric Company, which has outgrown all his other undertakings. In Europe experiments with the alternating current were attracting expert attention. He purchased the patent rights for America. He brought Tesla to Pittsburg and backed him in his researches. The induction motor was a result. He bought Tesla's patents and immediately began to develop alternating current machines for commercial purposes.

Everybody said he was reckless. That didn't matter. Then they tried to stop him. He increased his efforts. Experts, competitors, scientific men, at home and abroad, prophesied failure. As he didn't fail, they filled the air with cries of "public danger." Prohibitive legislation was invoked in a dozen States (or were they twenty-two?) on the ground that by the use of the alternating current the risk to human life and to property would be so great that the system should be forbidden by law. But Westinghouse went on and succeeded; the opposition spluttered and died, and for years past the great developments in electrical work have been through the alternating current system.

He organized an engine-building company, built steam engines, gas-engines, and was the first man in the United States to undertake seriously the development of the steam turbine. He acquired the Parsons turbine patents for America. He organized an incandescent lamp company, the Nernst Lamp Company and a company for manufacturing the Cooper-Hewitt lamp. He will organize a company without more ado than another man will make over eating his breakfast. He has been known at the breakfast table to buy a copper mine, send a man to Europe to investigate a newly announced electrical discovery, and give instructions for a series of experiments to be made in some entirely new direction.

"A big man with 100,000 horse-power inside him," says Mr. Warren. "He has more physical endurance than any ten of the 25,000 men in his employ. He is always working, except when he sleeps, and he is a good sleeper. When one thing is accomplished another is begun. The successes do not chain his interest. Achievement attracts him, so he is ever doing some new thing, and thus his undertakings multiply. Once, when he sold a property at a price that would have been a snug fortune for another man, I heard him say: 'This will give me a little ready cash to conduct such-and-such experiments.' He probably has expended a quarter of a million on these experiments, and one of these days a new industry will spring from them."

The writer describes him as a typical American—one of the men who make two blades of grass grow where one or none has grown before. It is "playing

the game" that interests him. He is not one of the millionaires who keep yachts, racing stables, automobiles and picture galleries; he does not gamble, he does not smoke and never plays second fiddle in any orchestra. He always conducts. What he cannot control he will not touch. Amalgamations, consolidations, are not for him unless he is to be ruler of them. He takes quick likings and strong dislikes, and his ambition is to extend his great industries to many countries, to build them up there, so that they become, as it were, national institutions, and to have their products on every sea and in every land.

He is not far from realizing this ambition. Already the British Westinghouse Electric and Manufacturing Company is the greatest of its kind in the United Kingdom and has become in two or three years the most widely known industrial undertaking in the British Empire. On the Continent of Europe he has three manufacturing companies. The commercial territory of one of them extends from St. Petersburg to the Pacific. His foresight planned those companies, and his energy got them working before the countries in which they are placed could seriously oppose the import of American manufactures by a wall of prohibitive tariffs. Let them have tariffs now if they choose. These European industries of his are European, employing the capital and the labor of the countries where they are planted. The conception and the execution of this plan were Napoleonic.

The manner in which his British company was started was characteristic of the man. Anybody else would have begun over there in a comparatively small way. But he began there on a grand, even a gigantic, scale, everything about it entirely new. New works were erected at Manchester large enough to employ thousands of men at the start; there were 6,500 men on the payroll in the month of September last. All the machinery was new and specially made for this establishment. Four thousand men were required to build the works. Add the thousands who are daily employed inside—in the foundries, the electric works, the engine works, the draughting-rooms, the offices—and think what all this means to the earning power of Manchester, the sums distributed weekly in wages and paid out for material and supplies! Is it strange that Europe should welcome a man at whose word industries spring up like this, full-fledged?

Self-reliance is developed in George Westinghouse to an extent unusual even among those types of men we call born leaders. That fact gives the clue to his successes and his methods. He can do himself so many things that other men require trained assistance to bring forth. He lost an important suit after a hard fight, but within a few days he invented a device which fulfilled the requirements. Many a time in his career opponents have thought they had him in a corner, but he always broke through and gained abundant elbow room.

"Trade Follows Advertisements as Well as the Flag."

THE *Canadian Manufacturer* prints a paper from George Johnston, the Dominion statistician, prepared for the information of the Duke of Argyle, showing the effects of the tariff preference given by Canada to Great Britain. He claims that it has resulted to the advantage of both. Referring to the United States, he says: "It has the advantage of closer proximity to our markets and a thorough knowledge of our trade requirements. The United States also has an advantage in the fact that we must go there for certain raw products, such as cotton, and therefore having to go for some things we are more likely, once being there, to buy other things. We have on several occasions broken down a persistent attempt to destroy some particular branch of our industries by increasing the duty and threatening to go higher still, if necessary. Whether, on the whole, the United States has succeeded in causing the British manufacturer to sell to Canada at a lower rate than to other customers, I do not know; but when the United States maker has to meet British goods which pay a duty of 19 per cent. while he has a duty of over 28 per cent. against him he must feel that his geographical advantages are largely offset, and that under the preferential tariff he and his friend, the British manufacturer, are more nearly on an equality as competitors for Canadian trade than they ever were before.

"There is one subject which is intimately connected with the development of trade to which, however, your Government does not appear to attach as much importance as I do. Your newspapers do not circulate in Canada. The United States newspapers do. 'Trade,' we say, 'follows the flag.' It is even more true that trade follows the advertisements of the newspapers."

This Machine Handles Coal by the Ton.

THE apparatus that can bite up five tons of coal is known as an automatic grab-bucket. It was invented not long ago. The Carnegie Steel Company owns it, and its function in the world of work is to insert its great jaw into places wherefrom vast quantities of ore are to be removed. For instance, when placed alongside a laden steamship, it can gobble up and redeposit on dry land about 2,000 tons an hour.

Every day sees some new labor-saving or time-saving invention in the way of machinery for handling materials in bulk. This five-ton biter or grab-bucket measures 15 feet over all when its jaws are wide open. A three-ton biter measures 11 feet. They are something like great pairs of claws and their mechanism is so perfect that no supplemental shoveling up is necessary after they have finished unloading a vessel's hold.

RAILWAY TRAINS WITH WINGS.

American Inventor Expects to Travel 240 Miles an Hour with Aeroplanes' Aid.

CHARLES E. REEVE, an attorney and expert mechanic of Chicago, U. S. A., has evolved an idea which he believes will result in trains being able to travel at a speed of 240 miles an hour on "modern rapid-transit" railways, with overhead structures and suspended cars. It was his work on the airship problem that led to Mr. Reeve's discovery of his proposed system. Indeed, his patented locomotive car and track system are simply an application of the airship principle to the operation of the modern railroad systems on elevated railroad tracks. But instead of running the trains on top of the tracks Mr. Reeve suspends the trains from the tracks. The cars will run on wheels revolving at the top instead of at the bottom, as at present. The wheels will rest on overhead rails, which they cannot leave or "jump," no matter what sort of collision or other accident may happen. Perfect safety in travel combined with a minimum speed four times as great as that of the fastest trains of to-day will thus be attained.

Except that the wheels of the trains will be on the top, not the bottom of the cars, the make-up and general appearance of the "modern rapid-transit flyers" will in no way differ from the appearance and size of the present trains in which the traveling public are carried both on the surface and elevated railroads in city, State and nation.

The most unique as well as the most startling feature of the invention is Mr. Reeve's application of the aeroplane device to overcome friction and make the very highest degree of speed both safe and possible. By means of these aeroplane contrivances—which will have the function of wings—he intends to make the atmosphere do most of the work now done by the wheels and rails when a train is moving. In other words, the fear of overheating from friction will be overcome, as the journals and bearings of the Reeve wheels will undergo no more wear and tear nor do any more work when the train is going at a rate of 240 miles an hour than they do when going at a slow rate of speed or simply are standing still.

"In our improved car," says the inventor in a prospectus that he has just issued in connection with the work of promoting his plan toward the practical success that he foresees for it, "we have made the driving-wheels $3\frac{1}{2}$ feet in diameter, so that if we give them the same number of revolutions as the German suspended electric cars ours will be driven eight miles per minute; besides, the bearing of our wheels need not sustain the weight of the car. We have provided our cars with a system of aeroplanes or thin sheets of metal which cut the air at a slight angle, so when the car is in motion there is a continual upward pressure by the air on the planes, thus sustaining the weight of the car and taking that weight off the track.

"Therefore, our elevated structure need only be strong enough to hold up the rails, so that we have something solid to push against to drive the car forward; and having taken the weight off our journals we can successfully use ball-bearings and thus remove all possible danger of overheating the journals even at a speed of ten miles per minute.

"But, about the possibility of accident, how can we produce absolute safety? Simply by eliminating the elements of danger. In 298 railroad accidents out of 300 the deaths and injuries were either caused directly or were multiplied by the cars leaving the rails. We have the block system and the interlocking switch to prevent collisions; but what have we to prevent the car leaving the track? Nothing at all except simply the weight of the car.

"We have become so used to it that many of us have never realized the awful danger of riding on a rapidly moving railroad train and trusting to luck to remain on the track. Has the thought ever come to you while flying along over a track that the only thing between you and eternity is one little inch and a quarter flange on one edge of the wheel, and that a pebble or any little obstruction on the rail that will raise one wheel an inch and a quarter will cause the train to leave the track, taking you into eternity?

"Our modern rapid-transit cars cannot leave the track. They are provided with driving-wheels engaging the upper edge of the rail, and these are geared with other driving-wheels that engage the lower edge of the rail and both have flanges on the outer side of the rail, and guard flanges on the inner side of the rail, so that from the time the cars are constructed until they are absolutely worn out and sent to the scrap heap they can never leave the rail."

Explaining his system, Mr. Reeve said: "A railroad that now costs \$20,000,000 to build and equip can be built and put in readiness for operation under my system for \$1,000,000. It is my firm belief that my system will revolutionize railroading. To have the wheels at the top, not at the bottom, is the only safe way to operate trains. Although our aeroplanes will sail along over the trains like so many mammoth Gainsborough hats on the heads of women, there will not be any serious objection to the planes on the score of cutting off light or air from the public. For it is possible to have the aeroplanes made of transparent material if necessary.

"True, the aeroplanes will be about three times as broad as the width across the tops of the cars of trains as the cars are at present built. But no inconvenience will on that account be experienced, as the chief purpose of our system will be to afford not so much the facilities of municipal or urban rapid transit, but rapid transit across the continent. It is our hope to do more in annihilating magnificent distances than short distances. In other words, our great aim will be transcontinental rapid transit."

New Novelties in American Hotels.

SOMETHING new is constantly sought in America and the novelties that develop take odd forms. The proprietor of one of the new hotels intends to provide for the use of his regular patrons individual knives, spoons, forks, cups, drinking-glasses, napkins and towels. There will be no extra charge, and each article will bear the initials of the guest. The only consideration is that the user shall agree to take lodgings for one month or longer.

"Isn't it a good idea?" he asked of a reporter of the *New York Sun*. "My ware is all quadruple plate. To cut an initial or monogram will cost practically nothing. It will be cut very light, so that after a month's use or such matter, it can be removed and a new one cut in its place.

"For whole families of five to ten people it will be necessary to provide complete sets of ware, glasses, cups, etc. I shall not be stingy. To etch glass nowadays is so inexpensive that the extra cost would not be noticed. Suppose I have a single guest's monogram cut on half a dozen of each kind, the chances are all will be broken by the end of his stay.

"If families living in the hotel insist on it, I shall have complete sets of dishes for them also monogrammed. If fifty such families were staying with me I would try to have fifty different designs of plates and dishes in fifty different colors or tints, so that they could be easily distinguished.

"It is not necessary to burn a monogram into china nowadays. There is a preparation that is applied with a rubber stamp just as easily as you stamp a signature. The stamp is not indelible, but comes off only in scalding water. A boy at \$4 a week could stamp fresh every day all the sets of china I'd be likely to use.

"There is a new style of marking silver that I guess you haven't seen, either. It's done with a rubber die and looks like the finest enamel. I'm going to try it on my knives, forks and spoons. They tell me it is better than engraving where it isn't wanted to last forever. One application, well baked in an ordinary oven for two hours, will last, I am told, ten to twelve days.

"One of my rivals in Chicago a few years ago tried to introduce the paper napkin. He had some very delicate ones made with the stamped monogram of the hotel thereon, but the people wouldn't have them. There's a free-lunch style about a paper napkin that we haven't been able as yet to overcome.

"A paper manufacturer showed me the other day some material for napkins that is as soft as velvet, as white as snow, as absorbent as blotting-paper and sufficiently tough to answer all purposes. Why, it's pretty enough to make your wife a summer dress out of. And it's paper—only paper.

"Now, I'd like nothing better than to put some napkins made out of that stuff on my tables, but I haven't the courage. It is, however, only a matter of time when all tablecloths and napkins in hotels will be made of paper, and hotel towels, too."

Well-Borers and Windmills Needed in Greece.

UNITED STATES CONSUL D. E. MCGINLEY, at Athens, Greece, urges the exportation to Greece of American well-boring machines and windmills together, because the situation requires that the two machines should enter it hand in hand, as it were, as the best and surest means of giving the valleys of Greece what they most need—a sufficient supply of water for irrigation. He adds: "The introduction of the two kinds of apparatus will be a revelation to the peasants and to the residents of the cities as well. The introduction of the well-boring machine will add greatly to the demand for windmills, as the model of digging wells in general use here is both slow and costly—costly even with the very cheap apparatus and labor used. And the introduction of windmills will create a demand for more and better wells." Consul McGinley advises that experienced men be sent along to show how the machinery operates, and says by way of explanation: "In a land like this where machinery of any kind, except the most primitive, was unknown to the peasants until within the last few years, it cannot be expected that the peasant will take hold of a well-boring machine or a windmill and operate it as successfully as does the average American farmer; and it is not so many years ago that the average farmer of the United States was not very expert in the use of new-fangled machines."

Vehicles on Water Skates Are Impracticable.

FROM Germany comes a proposition that wheels shall be displaced by runners, or slippers, in all transportation vehicles. The cars are raised on a thin film of water, which is forced under the skates, through a jet. In the earlier plans the propelling force contemplated was a horizontal jet of water, which was directed against suitable vanes on the bottom of the cars. The valves of these jets were opened by the leading car and closed by the rear car. In the plan, as now proposed, a third rail is laid between the two gliding rails and a friction wheel, driven by electric motors, runs on this and furnishes the propelling force. The advantages claimed for this system of traction are great reduction in the track resistance and in the power required by a car, a much smoother running of the car, and hence a smaller depreciation both of track and car. There is said to be no danger of derailling the car and high speed can be attained. By cutting off the water supplied under the skates breaking up the car is effected. An attempt in this direction was made in America some years ago, but was found to be impracticable. The storage of sufficient water to use in operating the vehicles was a problem that could not be overcome.

MICHAEL'S LAWN SPECIALTIES

Have been on the market over 46 years,
and have successfully stood the test of time.

Our Motto Is: **QUALITY** in Every Instance.

New Michael Lawn Swing.

For grace, solidity and beauty the New Michael Four-Passenger Adult Lawn Swing has no equal. All parts are bolted or screwed. We use no nails except in chair slats. No tools required in setting up. We guarantee the New Michael Four-Passenger Adult Lawn Swing to be the best made. Opens and closes like a jack-knife. Contains about 20 cubic feet each, and weighs, each, 150 lbs.

Price, per half dozen.....\$30.50

Michael's Folding Rocker.

Is the neatest and best article ever placed before the people. Folds as shown in cut. Painted red or green, or natural wood finish.

Six Folding Rockers, crated, containing about 14 cubic feet; weight, 48 lbs.

Price, per dozen..... \$9.00

Michael's Lawn Settees and Folding Chairs.

Our Lawn Settees and Folding Chairs are the most practical ever placed upon the market. The curve in back is exactly right. Painted red or green, or natural hardwood finish. Six 5-foot Settees, crated, containing about 25 cubic feet; weight, 96 lbs.

Price, per dozen.....\$18.00

Six Folding Chairs, crated, containing about 14 cubic feet; weight, 30 lbs.

Price, per dozen..... \$6.00

NOTE.—The prices above quoted are f. o. b. New York City.

We also make the Michael Porch and Lawn Reclining Chair.

C. H. MICHAEL MFG. COMPANY,

Cable Address, "Michael," Western Union Code.

LA PORTE, - INDIANA, U. S. A.

MILLING CUTTERS

**SPECIALLY MADE FOR HIGH-SPEED
MILLING AND ACCURATE FINISH.**

Visit Our Exhibit, Block 13, Machinery
Hall, Louisiana Purchase Exposition.

**BECKER-BRAINARD MILLING
MACHINE CO., Hyde Park, Mass., U. S. A.**

American Goods Popular in France.

A WRITER in *Leslie's Weekly* contributes to current information a remarkably interesting article, from which the following extracts are made: "In Nice," he says, "I rode in American trolley cars over American rails, this electric traction system being operated by an American concern. At Limoges I visited outlying farms that were operated entirely by American farm machinery and dairies similarly equipped. At Nice the people drove to Monte Carlo in American carriages, the horses wearing American harness. At Liège American shotguns and rifles were shown to me in three different shops. At Lyons, where I visited the great silk mills, I found the workmen making packing-boxes—the very boxes in which silks are packed for shipment to New York—of American planed boards. In every factory I found American labor-saving tools, and in half the offices I saw American typewriters. At all ports I watched the unloading of cargoes of American coal, and a French merchant told me that his countrymen are convinced that the United States is about to supplant Great Britain in the European coal markets as the chief purveyor of that fuel. On the railroad on which I traveled from Paris to Orleans, American coal was used exclusively. In Paris I saw no end of American bicycles, and many of the French cycles were equipped with American tires. At my Paris hotel I noticed that the window fastenings and door handles were supplied by a firm in Connecticut. In a little hotel in Dijon I was served with sweet potatoes from North Carolina, these being actually among the first sweet potatoes used in France. Refrigerated American beef could be had in any first-class restaurant. The elevator that carried me upstairs at the hotel in Paris was from a New York maker, and the electric fans in the dining-room were imported from that self-same American city.

"To get at the real reason of our success in France we must understand that it is not *because* of conditions, but *despite* them. As a matter of fact, every single article coming into France from America, excepting the few articles included in the reciprocity treaty of 1898, is charged the maximum tariff rate. In other words, enormous duties are levied on American articles in contradistinction to the more favored nations, so that every commercial nation, except the United States, obtains the benefit of the minimum tariff rates of France. How, then, do we manage to get such a foothold? Here is the answer in a nutshell: First, we supply a better grade of goods at a lower cost than French manufacturers can meet, and behind that still is the prevailing fad."

Steady Growth of Our Exports Into Canada.

EXPORTS from the United States to Canada were larger in the fiscal year just ended than in any preceding year. Reports prepared by the Department of Commerce and Labor, through its Bureau of Statistics, show for the ten months for which figures are already received, total exports to Canada amounting to \$104,000,000, against \$98,000,000 in the corresponding months of 1903, and \$89,000,000 in the same months of 1902.

Going back to 1897, the year in which the Canadian reduction in tariff on imports from the United Kingdom went into effect, the figures of our exports to Canada during the ten months ending with April, 1897, are \$51,903,579, or but one-half those of the ten months ending with April, 1904.

The Canadian reduction of duty on imports from the United Kingdom and certain of its colonies began in April, 1897, with a reduction of 12½ per cent. In 1898 this reduction was increased to 25 per cent., and in 1900 to 33½ per cent., and has so continued up to the present time. A table showing the total exports from the United States to Canada, covering a long term of years, indicates that there has been more rapid growth in exports to Canada since 1897 than at any period preceding that year.

For the full fiscal year our exports to Canada were, in 1874, \$41,000,000; in 1884, \$44,000,000; in 1894, \$56,000,000; in 1897, the year in which the Canadian reduction of duty on imports from the United Kingdom occurred, \$65,000,000, and in 1904 seem likely to be nearly or quite \$130,000,000, and will exceed those of any preceding year.

Comparing the growth of Canadian imports from the United States and the United Kingdom since 1897, the Canadian figures show imports for consumption: From the United States, in 1897, \$61,649,041, and in 1903, \$137,605,195; from the United Kingdom, in 1897, \$29,412,188, and in 1903, \$58,896,901.

Must Use Wireless Ears.—One of the attractions at the St. Louis World's Fair will be what is called "the noisy, noiseless court," which is the invention of an electrical engineer of New York. No specific details have been published, but the idea is to demonstrate wireless telephony. Within the stone walls of the court no sound is to be heard until a pocket telephone receiver, unconnected anywhere with wire, is put to the ear, when the playing of a brass band, the elocution of monologuists, etc., at once become audible.—*American Inventor*.

Lectures on Russia in American College.—In following a policy adopted during the Boxer troubles in China (when a department of Chinese was established), Columbia University of New York has announced that next fall a lectureship in Russian history will be started under the auspices of the faculty of political science. The first incumbent of the new chair will be Dr. Vladimir Simkhovitch, who has been the supervisor of the department of serials in the university library.

Japan's Trade with United States Increases.

WITH a view to correcting the impression, generally entertained in manufacturing and commercial circles here, that the Russo-Japanese war is reacting upon the trade of the latter country, the Director of the Foreign Department of Commerce and Labor at Tokio has compiled the export figures from the United States to Japan for the first quarter of 1904, as compared with the like period of 1903, showing the contrary to be the case. The foreign commerce of the United States in 1903, compared with that of 1893, increased as follows:

	Per cent.
Commerce with South American countries.....	30
Commerce with European countries	60
Commerce with North American countries.....	80
Commerce with Asiatic countries	275
Commerce with South African countries.....	475
Commerce with Japan increased	800

The Director says: "Instead of the normal demand having fallen off because of the war, it has increased owing to the extra stimulus given to business by the war, and the fact that Government officials everywhere are emphasizing the importance of all non-combatants attending strictly to their peaceful vocations in order to promote domestic commerce and industry so as to meet all the necessary expenses of the Government and maintain the national stability and credit."

The Director's figures are sustained by a report issued by the United States authorities at Washington. It appears Japan's commerce with the United States in the fiscal year ended June 30th shows a marked advance over that of any preceding year, and for the twelve months ended June 30th will probably exceed \$70,000,000. Figures covering the first eleven months of the current fiscal year have been issued from the statistical bureau of the Department of Commerce and Labor showing American exports to Japan amounting to \$22,594,713, as against \$19,854,843 in the corresponding months a year ago.

Opportunities Will Follow the Far East War.

JAPAN has a very interesting periodical called the *Sun Trade Journal*, which contains the following editorial of value to exporters and others interested in international trade: "The progress of the war so far shows that the palm of victory will remain in the hands of the Japanese. According to the latest informations, Japan has completely established her supremacy on the seas. One of the greatest fears entertained by the Japanese at the commencement of the war was the comparative weakness of their navy. If the navy wins the victory of the army is a foregone conclusion. The question how long the war will continue is an open one, and yet when peace is restored there will be grand opportunities for foreign manufacturers to push their interests in the Far Eastern markets; but the seeds are to be sown if they would reap fruits. It seems to us now is the best time for sowing the seeds. Watch for opportunities."

Regarding the war's effect upon business in Japan, the *Sun Trade Journal* says: "Japanese business men were prepared to a certain extent to meet the difficulties arising from the war with Russia, so that they are not surprised that their business is affected by the war. We have not heard any complaints made by business men against the war. Patriotism has a greater influence upon them than money. Contributions are freely made, and if the war is prolonged Japan can meet financial difficulties with the sympathetic supports of foreign powers, especially England and America. At the beginning of the war it was generally feared that even if Japan should win she would be financially crippled, so that her condition would be worse than before. So far this fear has not been substantiated."

Postal Service in Panama Canal Zone.

ARRANGEMENTS for postal service in the Panama Canal zone have been practically completed by the officials of the United States having that matter in charge. Post-offices were started last month in Culebra and Matabachin. United States mail messengers will be on each train on the railroad receiving mails from the local postmasters on the line and delivering the same at the offices in Cristobal and Ancon, the Atlantic and Pacific terminals of the canal zone.

Arrangements are being made with the Panama postal authorities to receive and forward the South American and Central American mails. Regular mails for the United States and her possessions will be forwarded to New York by the postmaster of Cristobal. Registering and money-order offices will be established as soon as possible.

Mail matter from the United States to the canal zone and vice versa will be carried at the regular domestic rates of 2 cents, gold, but for Panama and Colon and all points outside the zone the regular foreign rates will be charged, in accordance with the international postal convention at Berne.

The B. F. Sturtevant Company.—Announcement is made of the removal of this company's entire plant from Jamaica Plain to its new works at Hyde Park, Mass., U. S. A. With nine acres of floor space and all the modern appliances, it will continue to manufacture blowers, engines, motors, economizers, forges, steam heating, ventilating and drying apparatus, etc.

Griffin Cleaner and Paste Combination

for Cleaning and Polishing Russet and Russia Leather Shoes and all Articles made of Russet and Russia Leather.

NOTE—Our Cleaner contains no Camphor.

Our Cleaner and Paste Combination for cleaning and polishing Russet and Russia Leather Shoes (and all articles made of Russet and Russia Leather) cannot be surpassed, if used according to directions. The Cleaner cleans and removes stains, and the paste produces a brilliant, durable waterproof polish, which is not sticky or gummy. We also make it in different colors, ox blood and brown.

Price per gross, large size.....\$14.00

Price per gross, small size..... 7.50

Discount, 10 per cent.

Griffin Russet Leather Polishing Paste.

Our Russet Leather Paste for producing a high gloss on Russet and Brown Leather Shoes (and all articles made of Russet or Brown Leather) cannot be surpassed, if used according to directions. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and yet is not a varnish.

Excellent for vici kid.

We guarantee it not to injure the leather in the slightest degree, as it is free from acids, and will not soil the finest of fabrics.

If the shoe is dirty it should first be cleaned with Griffin Russet Leather Cleaner.

Price per gross, large size.....\$6.00

Price per gross, small size..... 3.50

Discount, 10 per cent.

Griffin Russet Traveler's Outfit.

An excellent thing to take along when traveling.

Contains a bottle of cleaner for cleaning and removing stains. A box of our polishing paste and a polishing mitten.

Price per gross.....\$18.00

Discount, 10 per cent.

Our Parisian Dressing.

A Black Dressing for Ladies' Shoes. Is considered by good judges to be the best and nicest put-up 10-cent dressing on the market.

We guarantee it not to contain anything injurious to the leather. It contains oil which helps to keep the leather soft and pliable. Packed in one and three dozen boxes.

Price, per gross, \$8.00. Discount, 10 per cent.

Griffin Sterling Combination

Our Sterling Combination for dressing and producing a gloss on shoes made of Box-Calf, Cordovan, Vici Kid, French Enamel and all fine dry black leathers. Cannot be surpassed if used according to directions. It is easily applied, polishes quickly and easily; its lustre is brilliant, durable and not sticky or gummy and will not crack or scale off. It keeps the finest of leather soft. We guarantee it not to injure the leather in the slightest degree, as it contains no acid or other injurious substances.

A circular in each package giving full directions.

Price per gross, large size.....\$15.00

Price per gross, small size..... 8.00

Discount, 10 per cent.

Griffin Patent Leather Polishing Paste.

Our Patent Leather Paste for restoring the gloss to all articles made of Patent and Enamel Kid Leather cannot be surpassed. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and is not a varnish, as it leaves no coating.

We guarantee it not to injure the leather, as it is free from acids.

It is invaluable for brightening the saddle and blinders of harness, as the polish is waterproof.

Just the thing for manufacturers of harness to use, as it will prevent the Patent Leather parts from becoming dull.

Price per gross, large size.....\$6.00

Price per gross, small size..... 3.50

Discount, 10 per cent.

GRIFFIN SNOW WHITE.

For cleaning and re-whitening white shoes made of canvas, suede and buckskin.

Price, per gross, \$10.00. Discount, 10 per cent.

NONE BETTER MADE AT ANY PRICE.

Send us a trial order through any commission house in New York; above prices f. o. b. N. Y.

GRIFFIN

High-Grade Shoe Polishes.

GRIFFIN M'F'G CO.,

82 Cortlandt St.,

New York, U. S. A.

Griffin Sterling Traveler's Outfit.

For Box-Calf, Vici Kid, French Enamel and all dry Black Leathers.

Put up in a carton. Contains a bottle of Sterling Dressing, a box of Polishing Paste and polishing mitten. Also suitable for Enamel and Patent Leather.

Price per gross.....\$18.00

Discount, 10 per cent.

The German Kaiser and "The American Danger."

WHAT has been called "The American Danger" in Germany is given attention in a long article in *Leslie's Weekly*, from which these extracts will interest our readers in other foreign countries:

"It should be explained that German animosity against America is confined to, and encouraged solely by, the commercial class. All other classes in Germany are friendly to the United States, this friendly party including the nobles, the professional and official classes, and the social and diplomatic element. This pro-American faction is headed by Kaiser William II himself.

"To illustrate the distinction between the antagonistic and the friendly class, I cite the following facts: When the Chamber of Commerce of Berlin prepared for its recent annual banquet, invitations were sent to all foreign ambassadors, with the single exception of the American Ambassador, Mr. Tower. This is accounted for only because of the fact that the Chamber of Commerce, as a body, represents the commercial—and therefore anti-American—class.

"Now, mark the rebuke that immediately followed, administered by the Kaiser as the representative of the pro-American class. The day succeeding the banquet my duties called me to the American embassy. A dense throng of people filled Unter den Linden—the Fifth avenue of Berlin—and that part of the crowd around the embassy seemed particularly reluctant to yield to my request for 'way' for entrance. One of the policemen who lined the avenue came to my rescue, and I secured a place in an upper window of the embassy just in time to witness the imperial rebuke already referred to. '*Hoch der Kaiser!*' or something to that effect was flung forth from 10,000 throats. His Majesty was coming. He had just returned from a hunting trip, and was now driving from the railroad station to the palace. He was seated in one of his less pretentious carriages and was attired in his hunting costume. In a second carriage, exposed to the delighted public gaze, were the trophies of the royal chase—antlers, skins, deer-head and the head of a wild boar.

"Over the building—practically American territory—from which I watched the scene, floated the American flag. As His Majesty approached the embassy he stood up in his carriage, bared his head and saluted first the Stars and Stripes and then the representative of our national emblem, Mr. Tower, who stood in one of the windows. No act could have impressed the populace as this simple demonstration of their sovereign's friendly feeling toward the United States. It was intentional and it was dramatic, as is every public act of the Kaiser's. It was significant, and the people understood why; for the newspapers that very morning were full of the story of the marked discourtesy of the Chamber of Commerce in not inviting the American Ambassador to the banquet. Nor does the story end here. The following morning the papers announced that His Majesty had graciously presented the Ambassador from the United States with the handsomest pair of antlers brought from the hunting-field.

"And still a third chapter there is. A few nights later a dinner was given on board one of the Hamburg-American Line steamers at Hamburg, to celebrate the launching of a great new vessel belonging to the company. At this dinner Mr. Tower was a guest, and it was he who sat on the right of the Kaiser—who invariably attends to such celebrations. This mark of distinction was interpreted by some as having significance only in the fact that the principal trade of the line was with America, but the pro-American element gave it what was unquestionably the correct construction—that is, a third in the series of imperial rebukes to the foremost commercial body in Germany."

Gigantic Dam Suggested for the Port of London.

CONSIDERABLE interest has been aroused in America by the suggestions which have been made for the improvement of the port of London by the erection of a gigantic dam, or barrage, in the Thames at Gravesend, and the conversion of the river from that point to London Bridge into a lake instead of a tidal stream. At present London labors under the disadvantage that its tides impair the usefulness of the port and result in great and unnecessary expense to the owners of vessels, which would be altogether obviated should the plans for a barrage be feasible and be put into execution.

It may be presumed that the plan owes its origin in large degree to the successful execution of the great barrage in the Nile, one of the most remarkable achievements of English engineering skill exhibited in recent years. The project, as expounded by its originators, involves the construction of a barrage somewhat similar to that on the Nile at Assuan, but, of course, of smaller dimensions, across the Thames at Gravesend, some twenty miles below London. It is to contain numerous adjustable sluices, together with a series of the largest-sized locks suitable for raising and discharging modern vessels of the heaviest tonnage.

The dam is to be so built as to keep the water behind it at about the present high-water mark, and the great increase of depth, ranging from 65 feet at Gravesend to 32 feet at London Bridge, would have an obvious result as regards all purposes of navigation at the port of London. It would do away with any necessity for dredging by adding water at the top, and under such conditions ships drawing 30 feet could proceed to London Bridge at any hour of the twenty-four without waiting for tides, while vessels of all tonnages and draughts could lie alongside any wharf or dock, remaining at one level for loading or unloading.

Another very sensible advantage would be the doing away with the tidal entrances to the various London docks, which now have to be maintained and

worked at a considerable expense, it being estimated that the cost of these gates amounts to between \$250,000 and \$500,000 per annum, constituting a severe additional tax upon London's sea commerce. It is furthermore urged that after the construction of the dam the foul water of the present tidal river will be pushed out by the influx of that which comes from the upper portion of the stream, and it is claimed, in addition, that the absence of mud and flats, the reduced cost of towage and barging, freedom from swinging with the tides and the collisions which it produces are among the incidental advantages, involving in all cases a reduction not only of risks, but of cost as well. In short, the proposition involves the establishment of a fresh water lake in place of the muddy estuary which now serves as the sea entrance to the greatest city in the civilized world.

The scheme has not yet passed beyond the stage of mere suggestion. In fact, there are complications in the way of obtaining the necessary authority from the British Parliament, which would be one of the chief prerequisites. A measure is already pending before that body for the acquisition by the public of title to the various London docks. It would seem, in the opinion of competent American observers, unnecessary to push an arrangement of this kind, if the elevation of the water level, which would follow the erection of the barrage, should place the docks and wharves and piers, either those in existence or the new ones which would undoubtedly be constructed, on a perfect equality as regards this service and operation. The matter, however, is exceedingly interesting, and it is to be presumed that some steps of the kind will be taken with a view to the maintenance of London's commercial importance among the ports of the world.

Progress in Windmills—American Substitutes Are Better.

ELECTRICITY is becoming increasingly useful in farming, and with its growing importance come the various experiments at harnessing the wind and making it drive the generators. Water-power, of course, is used where it can be obtained as a prime mover; but where it cannot be had steam has been called in. Steam is expensive, however, and of late experiments with wind-driven generators have become numerous.

Windmills are as common in many parts of America as in Holland, but hitherto have been used chiefly for purposes of irrigation. Recently, however, they have been used to generate electricity—at first for lighting houses and barns, but now for running motors used in driving light machinery. At two experimental farms in Germany two complete electrical plants are in operation, deriving their power solely from the wind, and in this country windmills are in use, connected with generators or with pumps, as the need of the hour demands, although these are experimental attempts to harness the air.

On some farms several mills are coupled in operating the generators, and 10-horse-power motors are worked. On other farms the windmills and the motors are distributed, producing lower powers at various points, rather than high power at a single point. Even a single large windmill may generate enough power to run a 2 or 3 horse-power motor.

Despite the advantages that might seem likely to follow from the progress which is being made in utilizing the wind, we doubt if it can ever be satisfactorily harnessed for economical, commercial or agricultural purposes. We print the above account of what is being attempted purely for the information of our readers. The experiments are interesting, but that is all that can be said. For practical purposes the windmill is beaten to a standstill by American appliances for use in its place—machines that cost less than windmills and possess continuity of action, with power graded to the tasks that are to be encountered. Our manufacturers have provided marvelously efficient substitutes for windmills. American gas, gasoline and hot-air engines have reached a degree of perfection and have stood such satisfactory tests in so many countries of the world, outside of our own, that we are really surprised to learn that anybody is seriously making a deliberate attempt to "harness the wind." Such a man might easily be expected to transfer his cash account from the Bank of England or the National Park Bank of New York to a sand-bank.

American Carpet Sweepers Are Up-to-Date.

SAID a New York merchant recently: "How old is the carpet-sweeper? Oh, I guess about thirty years, and when it was first brought out it was carried about from house to house by canvassers, who showed its operation and sold one when they could. Now the carpet-sweeper is everywhere as among the essentials of household equipment."

"American carpet-sweepers are exported to every civilized land. One American concern has a carpet-sweeper factory in France. If there is a household article of world-wide use it is the carpet-sweeper. Sweepers in carload lots, from factory to distributing centers, are common shipments.

"Originally made with a view to purposes of utility solely, and so with the simplest and plainest of hardwood cases, carpet-sweepers are now made of all sorts of fine woods. You can now buy a carpet-sweeper with a case of figured rosewood or of Hungarian ash, of bird's-eye maple or of California laurel, of curly birch, of oak and of mahogany, and so on, and these can be had in different styles of finish. Carpet-sweepers are now made in many sizes, ranging from little toy sweepers up to the regular 14-inch size, the standard for domestic use, and from that up to the big 28-inch steamboat sweeper."—*New York Sun*.

Aspinwall Potato Machines

Make Large Profits Easy by Economizing in Time, Labor and Money.

We make a strong, practical and automatic machine for every stage of Potato Culture; in fact, the Aspinwall is the only complete potato implement line in the world.

With Our Machines seed is quickly cut to best advantage. Planting, fertilizing and covering are accomplished at any depth and width of row desired. Spraying is effectively done for bugs and blight. Digging and sorting are made pleasant and agreeable work by our time and labor saving machines.

Our catalogue, illustrating and describing the various styles of

ASPINWALL POTATO
Planters, Cutters, Sprayers, Diggers and Sorters
made by us, mailed postpaid.

Aspinwall Mfg. Co., Jackson, Mich., U.S.A.

PRESIDENT SUSPENDERS

Known everywhere for their comfort, style and service. Made in four weights; hundreds of different patterns.—Absolutely guaranteed—Genuine has "President" on buckles.

BALL-BEARING GARTERS

Swing like a pendulum with the motion of the leg. Lay flat; no binding; fit every leg perfectly. Easily adjusted. No stitching. Extra long adjustment.

Finest web, in many colors and patterns; packed in handsome boxes, 12 to carton. Handsome counter show-case with 3 dozen.

PRESIDENT SUSPENDERS, \$4.37½ per doz., for all models except "Extra Fine," which are \$7.19 per doz.

BALL-BEARING GARTERS, per doz., \$1.95.

Terms, net spot cash, f. o. b. New York.

Liberal Discount on above prices in Quantity lots. Write for Discount Sheet. Illustrated Catalogue free.

The C. A. EDGARTON MFG. CO., Box 23A, Shirley, Mass., U.S.A.

THE WORLD'S GREATEST MECHANICAL TOY

Irving's Wizard Top

is a Scientific Wonder.

A Top within a Top. Made of STEEL, nickel-plated. Is a veritable **Rotary Engine**, gyrating in contrary directions while running at full speed. Its average spin is 8 minutes. Performs over 40 tricks. A child can spin it in 3 seconds. It maintains its equilibrium at any angle. Walks a tight or slack wire. **Has no equal in the novelty world.** Sells at sight. Over 500,000 sold in 17 months in the United States. The accompanying cuts illustrate only a few pedestal tricks.

See Special Export Proposition.

\$18.00. Upon receipt of Eighteen Dollars in U. S. gold, or its equivalent, we will box ready for steamer, f. o. b. cars New York, one (1) gross of the Tops, with Trick Outfits complete. Size of case, 24x12x11 in.; gross weight, 54 lbs.

Prompt Deliveries and Entire Satisfaction Guaranteed. ORDER NOW!

WIZARD NOVELTY CO., Inc., Philadelphia, U. S. A.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as by the ordinary method and is the only utensil that will produce **Lattice Potatoes**. Is extremely simple to operate and sells rapidly wherever shown.

\$16.50 Upon receipt of SIXTEEN and 50-100 DOLLARS in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] No. 6 X SLICERS, for Export only. Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our NO. 6 X SLICERS and other specialties manufactured by us.

HANDY THINGS CO.,

Manufacturers,

LUDINGTON, 40 to 50 Rowe Street, MICHIGAN, U. S. A.

JULIENNES **LATTICE POTATOES**

Power Direct from Coal Is Promised.

CHICAGO, the American city from which so many wonderful things in science are now emanating, has tackled the old-time problem of converting coal directly into power, without the use of the steam generator. The world will be skeptical, however, until the inventor, Hugo Jone, a chemist employed in the Chicago municipal laboratory, consents to give out more than a meager and unsatisfactory list of details. He terms his apparatus a battery and promises that it will soon supplant entirely all steam engines, because much of the power lost by the latter in friction and in other ways is saved and converted into power. Of course, it is a well-known fact that much power is lost by present appliances, but hear what he has to say to a Chicago reporter, to whom he talked:

"The new battery is going to supplant the steam engine, as its yield is four to five times as high as that of the steam engine—an advantage which has been thoroughly demonstrated and which will naturally prompt railroad companies, factory owners and others producing power or light to use the battery. All metals and other substances used in the Jone battery are easily reducible and easily oxidized as well. As a result, the processes in the battery, from a chemical point of view, are cycles in which the substances are recovered, so that they can be used over again. The coal is the only substance used up. None of the batteries hitherto in use can boast such an important advantage. At the same time the internal resistance is very low. Another big advantage is the fact that the electric current is of a truly electrochemical nature and not of merely thermal origin.

"The principal of the new advantages of the new invention may be summed up as follows:

"1. It requires only about one-third of a pound of anthracite coal for a horse-power hour, while the steam engine requires about two pounds, therefore about six times as much.

"2. If ordinary or soft coal is used the battery requires about one-half a pound of coal for a horse-power hour, while the steam engine requires about three pounds, therefore again about six times as much.

"3. Similar conditions prevail with other liquid fuels.

"4. Explosions, such as boiler explosions, the prevention of which requires so much care in the handling of steam engines, are an impossibility with the new battery.

"5. There will be less smoke with the new battery as power generator than there is with the steam engine.

"6. No limb-breaking machinery and no clumsy transmissions of power by means of endless chains and turning shafts.

"7. Compared with other batteries, many conveniences, such as the contamination of the air by acid vapors or the corrosion of the cell vessels, are eliminated.

"These advantages of the cell have been demonstrated by experiments and exact measurements, and are not at all based on mere theories."

The cost of a 16,000-horse-power engine is \$2,100, and Mr. Jone says that the cost of one of his plants of similar power would be \$1,400, and would be also an annual saving of \$150 in operation. In larger installations the saving by the Jone system would be greater in proportion. Our readers will be kept posted regarding any further developments relating to this invention.

Earning Power of American Traction Engines.

MANY of our readers will be interested in the following prize essay on the "Full Earning Power of a Traction Engine" which was written in response to the offer of a valuable prize by our esteemed contemporary, *The American Thresherman*, and which shows how American traction engines can be utilized anywhere in the world. The localities mentioned are in the United States. The prize-winner says: "In North Dakota the greatest use to which the traction engine will be put is undoubtedly threshing, but as this lasts but three months in the year at the longest it is to the advantage of the owner of every traction engine to find some profitable employment for his machine for the other nine months of the year; otherwise his engine and consequently the capital invested will be earning no interest, but rather deteriorating to some extent.

"When the country is new a traction engine can be very successfully used for the purpose of breaking up the prairie sod. The average price for breaking is about \$3 per acre. Three men and a 25-horse-power engine can break twenty acres per day on an average, in most localities, at \$3 per acre, or a gross earning of \$60. The expenses are about \$5 for an engine, \$2 for a fireman, \$2 for a tankman, \$3 for a team, \$3 for lignite coal and \$10 for wear and tear, making in all about \$30 for expenses. This would be 100 per cent. net profit on the investment. Of course, these figures will not always be realized, but there are many men in the western part of this State and the Northwest Territories who have exceeded this amount of net gain.

"Such an outfit should be able to plow about one hundred inches in width, but this will vary according to local conditions. There should be enough plows to make a reasonable load without overworking the engine.

"Traction engines may be used to advantage in many communities for plowing, after the breaking is done, but the prevalent loose sand after the land is worked for some time is so hard on the traction engine that plowing is generally not practical with a traction engine.

"In new sections of the country, especially where hay is very abundant and cheap, it might be a very profitable business to put in a large hay-press. In

this way the machine could be easily moved from field to field, and all the hay could be cheaply baled and shipped to older-settled communities, where it is a scarce article and always brings a good price. There is no reason why baling hay should not be found to be a profitable business over large sections of this country. On large farms especially, where there are large barns, it is much more economical to feed cut hay and straw. A traction engine is an excellent motor to run a large hay and straw cutter. In this way a barn can be filled full of finely cut feed, which can be fed to much better advantage than uncut feed. This is an opening for a traction engine, as yet hardly exploited.

"North Dakota is now in the corn belt to an extent undreamed of ten years ago. This makes the silo a coming necessity on every farm. For the purpose of cutting the corn and filling the silo some powerful motor is necessary, and the traction engine is about the only article that fills the bill in a satisfactory manner. In the future it is reasonable to expect to see the traction engines of this State earning thousands of dollars for their owners, filling large silos with the best cattle feed to be obtained in the country.

"Where cattle and sheep are raised in large numbers a dipping tank is a necessity. For the purpose of lifting and lowering the cage containing the animals to be dipped, the traction engine is the best motor obtainable. The boiler supplies plenty of steam to keep the dipper mixture at the proper temperature, and the cable which lifts the cage is attached to the rear end of the engine, so that by going ahead or backing up, the cage is raised or lowered smoothly, quickly and effectively.

"On many farms ground feed is a necessity, where large numbers of work-horses and dairy cows are kept. By means of a traction engine and a feed mill a farmer can easily and cheaply grind up enough feed to supply his stock for half a year. It is always much more convenient to grind up a large supply in this way than to be bothered with grinding every little while with a windmill or hauling your grain to and from some distant mill.

"In some localities where wood is plentiful a circular-saw driven by a traction engine is the most economical method of cutting it, although small gasoline motors are displacing steam engines to quite an extent at this business.

"The digging of artesian wells has been a profitable employment for the traction engine throughout the artesian basin in Walsh and Pembina counties, as well as other localities, in the past and doubtless will continue to be for some time in the future.

"The construction of graded roads, drainage and irrigation ditches is just in its beginning in this State. For this purpose large graders will be the principal machines used. In most cases horses will furnish the power, but in many cases it would be found cheaper to use the otherwise idle traction engine. In this capacity the traction engine will doubtless earn fame for itself and gold for its owner over large areas of the Northwest States and Territories.

"Probably not any engine owner will be able to put his engine to all the uses mentioned above, yet most every man owning a traction engine will be able to find some other profitable work for his engine besides threshing. In any case the full earning power of a traction engine is only attained when the engine is run every day, paying the price of operation, the wear and tear on machinery, a reasonable interest on the investment and also a reasonable profit for the care and bother of operating the plant. Whenever an engine can earn that amount it should be run, but when it cannot do so it should be shut down."

Industrial Development of the United States.

WALTER H. PAGE, in the July *World's Work*, says that the most impressive social fact in modern social history is the industrial development of the United States. In our more prosperous States there are perhaps 40,000,000 of persons more comfortable, better fed, better clad, better sheltered, more healthful, more economically efficient, and with a higher level of intelligence; than any solid mass for 40,000,000 persons that ever before dwelt contiguously.

We have proved that, in a mobile social condition—a society in which men are free to choose their work and to develop their personal aptitudes—men find their highest economic development. From mechanics to great industrial organizers we have in this generation bred men that are the first of those that make things and the ablest of those that organize things. Thus has democracy justified itself industrially, and it has made a new chapter in the history of mankind.

Automatic Telegraphy for Business Men.—The *American Inventor* prints the following: "A South Orange, Wash. (U. S. A.), inventor has produced an automatic telegraph machine which he claims will land a thousand-word letter in a business office in Chicago half an hour after the words are dictated in New York. A stenographer punches out the message on tape, which is then fed to the transmitting machine. One minute suffices to reproduce the punched characters at the other end of the line. Another stenographer translates them. The cost to the sender in a New York instance (about 1,000 miles) should be from 10 to 12 cents."

Telephones in America.—The increase in the use of telephones in this country has been vastly out of proportion to the growth in population. In 1890 the city of Chicago had, roughly, one telephone to every 150 inhabitants. By 1900 the proportion had grown to one for every 55 inhabitants, but now it is one to every 25 inhabitants, and the increase elsewhere in the United States has been on the same scale. Subscribers now secure practically a 5-cent-a-message rate within their own municipalities.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 1/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the frons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

SIX-SECTION CASE.

Showing a six-section case with top and base set up, and the same case boxed K. D. ready for shipment; weighing 200 lbs. gross, 150 lbs. net, and of 10 cubic feet, thus securing a low freight rate, occupying but little space in warehouses and on shipboard.

ESTABLISHED 1846.

ESTEY ORGAN COMPANY,

Brattleboro, Vermont, U. S. A.

Cable Address: "Estey," Brattleboro, U. S. A.

Builders of High-Grade Organs and Pianos

Over three hundred and fifty thousand (350,000) in use throughout the civilized world.

The **Estey Reed and Pipe Organs** are specifically made for use in churches, chapels, music and lecture halls, Masonic lodges, schools and residences.

The **Estey Pianos** are made in several styles of Upright and Grand.

Our Catalogue, illustrating and describing the various styles of Organs and Pianos made by us, mailed postpaid to all parts of the world.

None but the most skilled workmen and the best of material are employed in the making of the **Estey Organs and Pianos**. Prices quoted F. O. B. cars at New York City. Specify "Estey," and when ordering, to avoid errors, please mail us a duplicate of order.

NOTE.—To facilitate the handling of our export trade we desire to communicate with one responsible musical instrument dealer in each trade center of the world.

ESTEY PIANO. Style 20.

Made in mahogany, oak and American walnut. 7 1/2 octaves, scale A to C. Height, 4 feet 3 inches; Length, 5 feet; Depth, 2 feet 3 inches; Weight, boxed, 850 pounds.

ESTEY ORGAN. Style "S."

Solid walnut or oak case. Height, 6 feet 8 inches; Breadth, 3 feet 10 inches; Depth, 1 foot 11 inches; Weight, boxed, 400 pounds.

White Enamel Refrigerator Co.,

ST. PAUL, MINN., U. S. A.

Owners and Manufacturers of

Bohn's Patent Dry Air Syphon System of White Enameled Refrigerators.

The Bohn Dry Air Syphon System insures a low and uniform temperature, ranging from 38 to 48 degrees Fahrenheit. With our Enamel Lining, you need only to wipe the food compartments with a damp cloth to clean perfectly. The only absolutely sanitary refrigerator made.

Adopted and used exclusively by the Pullman Company for all of their Dining and Buffet Cars. Pennsylvania Lines, New York Central, Michigan Southern, Union Pacific, Canadian Pacific and all other railways throughout "the States" and Canada as well as by thousands of homes, hotels and clubs.

For Foreign Markets Only.

The prices here quoted includes boxing ready for transportation and delivered F. O. B. cars at New York City.

No. 2. Style "A." Panel Door. Price, \$23.00. Outside measurements (inches): Width, 38; depth, 21; height, 44. Weight, boxed, 278 pounds.

No. 5. Style "D." Upper Door Glass. Price, \$49.00. Outside measurements (inches): Width, 48; depth, 26; height, 66; weight, boxed, 540 pounds.

NOTE.—Orders received direct, or through export commission houses. When ordering through the latter, to avoid errors, please mail us a duplicate of order.

Our forty-page catalogue, illustrating and describing the various styles of White Enamel Refrigerators made by us, mailed postpaid.

No. 2. Style "A." Panel Door.

No. 5. Style "D." Upper Door Glass.

A New View of America's Industrial Progress.

STATISTICS and comparisons are not always either interesting or profitable, but a summary of an article in the *Engineering Magazine*, in which William J. Clark, who is manager of the foreign trade of a great American electric company, discusses the reasons why America is the best market for manufacturers, is of interest, as showing why our manufacturers are enabled to sell their goods to foreign customers at such reasonable prices.

According to Mr. Clark, in the manufacturing plants of the United States in the year 1900 there were at work 5,308,406 wage-earners. These turned out in manufactures \$13,004,400,143. Average product value per capita of earners, \$2,450, or per capita of population, \$170. Total horse-power used in manufactures, 11,300,081. Horse-power per wage-earner, 2.15. Total consumption of manufactures, \$12,885,609,303. Approximate consumption per capita of population, \$169.

Mr. Clark proceeds to say: "The United Kingdom of Great Britain and Ireland had 9,000,000 wage-earners in 1900, yet their product in manufactures was but \$5,000,000,000, far less than half the output of our five million and odd of workers. They used only .33 horse-power per capita—one-seventh as much in proportion as we use. Germany reported 10,000,000 wage-earners, \$4,600,000,000 in products, .34 horse-power per worker. France, 5,000,000 earners of wages, \$3,450,000,000 in manufactured products, .30 horse-power per capita.

"Other European countries (and Japan, in Asia) ranged lower yet, but Canada, with 550,000 wage-earners, turned out \$800,000,000 in manufactures, which was \$1,455 per capita of workers and \$146 per capita of population, and the horse-power employed in the Dominion was 1.36 per head of workers.

"In point of consumption per capita of population Canada surpassed the United States, her 4,800,000 using \$880,000,000 in manufactures, or \$183 per head.

"The United Kingdom, 41,000,000 population, consumed \$4,273,397,438 in manufactures, or \$104 per capita; Germany, 56,367,000 people, \$4,152,450,000, or \$74 per head; France, 38,700,000 population, \$4,152,450,000, or \$82 per head; Belgium, 6,700,000 people, \$660,000,000, or \$98 per capita.

"In the particular of consumed products Australia came just after the United States, with a demand for \$605,000,000 in manufactures, or \$162 per capita, for a population of 3,700,000. Australia's own 550,000 wage-earners were credited with an output value of \$500,000,000. In bare totals of manufactures consumed, Russia, \$2,000,000,000, followed Belgium. Then came Austria-Hungary, \$1,900,000,000; Italy, \$1,714,000,000, and a dwindling procession in nine figures."

Finishing with his various tables, Mr. Clark declares that they "show conclusively that America itself is by far the best market of the world for manufactured products."

American Progress in the Bronze Industry.

BRONZE tablets, larger than any heretofore cast, have just been made for one of the great new bridges which is being built as an additional connecting link between the chief borough of New York City and one of its other boroughs. The casting is an evidence of progress in this branch of American industry. Some extracts are given below from a lengthy account of the feat recently published in the *American Inventor*:

The two immense bronze tablets that are to adorn the entrance to the Williamsburg Bridge across the East River, the most magnificent ever attempted or known to the art of bronze casting, were recently cast. These tablets, when completed, will be of gigantic dimensions, measuring 53 feet 7 inches in length, 4 feet 3 inches in breadth, and will weigh 6,000 pounds each. They are covered with a great amount of inscription, which gives the names and dates of the various commissions under whose direction the plans for constructing the bridge were formulated and carried into effect, with a concise history of its erection and a long list of the officials connected with the legislation that authorized the building of the structure, and of the men to whose practical genius was due the successful completion of this prodigious engineering feat. The letters of inscription vary from 3 inches to 9 inches in height.

The first and most important difficulty that confronted Mr. Hornbostel, the architect who designed the tablets, was to ascertain the feasibility of casting tablets of this immense size, as the proportions have no precedent in this line of work. In the art of bronze casting (the oldest known to civilization) the Colossus of Rhodes, a figure of the sun-god Helios, was an example of the utmost that could be accomplished. This statue was designed by the sculptor, Chares, and took him twelve years to perfect.

Among the hypothetical stages of the development of mankind "The Age of Bronze" occupied a prominent part. The oldest seat of bronze casting was the Island of Delos, and from here the art was disseminated throughout the Grecian and Roman empires. Later the Etruscans made much advancement in the use of bronze, but their successes were chiefly confined to its utilization for industrial purposes. With the advance of civilization bronze casting has always been closely identified with the fine arts, especially in Italy, Germany and France, from whose productions come the sculptural masterpieces. The United States is rapidly gaining a reputation in the use of this valuable metal for colossal statuary, but in the industrial arts of this country it has figured to an extent that surpasses all the various foreign centers combined.

The use of bronze for ornamental purposes is rapidly finding favor, and is

to-day taking the place of iron, marble and wood work in interior decorations. In fact, we find it extensively used for bank fixtures, tablets, stair-cases, doors, fences, ornaments and for every other purpose in handsome building construction.

Bronze is a combination of copper and tin in varying proportions, as required for the particular use to which it is adapted. The alloy thus produced makes a non-fusible metal, very hard, brittle and sonorous, well suited for casting. It requires a fine knowledge of the art to obtain the desired quality of metal that will acquire a fine patina or color upon exposure to the atmosphere, especially for exterior uses, and this can only be accomplished by the process of amalgamation. Other features of casting that call for great expertness are the making of the patterns and molds.

True Art in Furniture Due to American Monks.

FAULTLESS simplicity is a merit of what is called "Old mission furniture" that is conspicuous at the St. Louis World's Fair. In fact, the *Furniture World* declares that it has already carried off the palm, and asks: "If there is any State building or office or reception-room on the ground which isn't fitted out with 'mission' furniture, will it please speak up?" The *World* adds that the sway of this sort of furniture appears to be as absolute as that of the low-backed and bow-legged horsehair chairs and sofas of forty years ago. While it has swiftly become commonplace and been divested of all its novelty by its universal popularity, it has not lost the unpretentious comfort that first made it attractive.

The old mission chairs and tables, book-shelves and settees were constructed by Catholic padres of California solely for use. They were capacious, to suit the frames and purposes of holy men, who grew in avoirdupois as they grew in grace. There were no cabinetmakers' gimcracks about these chairs and tables.

In ignoring art they attained the truest art, the suitability of an object to its uses. A Franciscan friar yearned for no silk-embroidered roses on his chairback, or a divan with a hand-painted scene from Romeo and Juliet upon it. The first necessity was that it be big enough, the next that it be stout enough, and the third that it be substantial enough to last. So it was built.

For some 200 years or more it served the first Christian teachers on the Pacific Coast of the United States, and then some one with an artist eye spied it, reproduced it, and now you have it until you can't rest. Mission furniture is expensive, but it need not be. Any carpenter can build it of pine and paint it black. It requires no fancy, high-priced woods. It will soon be as common as deal chairs and tables, but it will never cease to be both cheering to the eye and the wearied frame.

If it totally puts to rout the traditional round-backed chair, into which no human back ever fitted, and upon which you hang your shoulder-blades, if you are lean enough, so much the better; but let us not forget that the monks in the old California monastery were the designers of this popular fashion in furniture.

No Standard Too High for Our Consuls.

SECRETARY CORTELYOU, of the United States Department of Commerce, had the following to say recently about our consuls and our foreign trade: "The comments by the newspapers and business of other nations indicate that our consular service compares well with that of other countries. But that is not enough, from an American point of view. While the work of many of the consuls is of a very high grade there can be much improvement. This fact was fully recognized by the President and by those of his officials who have immediate supervision of the work of the consuls. The suggestions made by the business public from time to time with reference to the practical problems which confront them in their attempts to increase their export trade will undoubtedly prove helpful in this direction. The consuls are essentially commercial officers. They should play a more vital part in the extension of our foreign trade. Their relations to the new department are one of its pressing problems. The Department of Commerce and Labor will do its share in the effort to improve this service whenever improvement is shown to be needed."

Manufacturing Oxygen.—A plant for the manufacture of oxygen, to be used in charging its distilled water, was put in operation recently at an ice plant in Los Angeles, U. S. A., says the *Philadelphia Record*. Oxygenated water is now being prescribed by physicians in certain diseases, and hence a cheap and simple method of separating the oxygen in the atmosphere becomes a matter of importance. The process employed by the Los Angeles company is based on the principle that manganate of soda readily parts with the oxygen it contains when subjected to the action of a jet of steam. Oxygen made by this process, it is claimed, contains no gas other than oxygen, and no elements of any description other than slight traces of atmospheric nitrogen.

Bulgaria Wants Our Goods.—John B. Jackson, United States Minister to Greece, Roumania and Serbia, and also diplomatic agent in Bulgaria, sends the following information relative to trade relations with the United States: "At present agricultural machines are almost the only direct imports from the United States. It has long been the wish of the Bulgarian Government to establish closer commercial relations with the United States, and the Prince of Bulgaria has expressed the belief that Americans could do a great deal toward the industrial development of his country, and that a market there could be found for many American products."

ANIMAL TRAP CO., ABINGDON, ILLS., U. S. A.

The Largest Manufacturers of
MOUSE, RAT AND GAME TRAPS IN THE WORLD.

Particular attention given to export orders. Illustrated catalogue free, giving full particulars. Order through your Exporter.

Rat Trap.

KNOCK-DOWN SHOW CASES FOR EXPORT.

SHOW CASE No. 31 is our leader for foreign markets, and is just the thing for displaying furnishing goods, chemists' sundries, dry goods; in fact, is well adapted for the display of any line of goods.

SHOW CASE No. 31 "set up" (ready for use) is 8 feet long, 42 inches high and 26 inches wide. Has 6 oxidized, copper-plated legs, giving ample room to clean under case. It is glazed with beveled plate-glass tops, and with double strength A sheet glass in fronts, ends and doors. The doors slide on ball-bearing rollers and a metal track. It is fitted with 2 wooden shelves, 10 and 14 inches in width, on nickel-plated, adjustable shelf brackets.

Our catalogue, illustrating and describing the various styles and sizes of Knock-Down Show Cases manufactured by us, mailed postpaid. Orders received direct or through export houses. When ordering through the latter, to prevent errors, please mail us duplicate of order.

8-Foot No. 31 Show Case.

Showing end view of an 8-ft. No. 31 Show Case set up for use, and an end view of the same case, knocked down and boxed for shipment. Weight, 384 lbs., gross; 248 lbs., net; cubic measurement, 28 cubic feet. Securing lowest possible freight rates.

American Ideas in the Leather Trade.

PROGRESS in the leather trade in this country has been remarkably rapid during the last few years. A writer in the *Shoe and Leather Gazette* treats the subject in an interesting way: "There is nothing like leather," remarks this gentleman, "but young men do not appreciate the fact. The college-bred youth and the high-school graduate usually turn up their noses at the tannery—a place of smells and dirty workmen—but I think they will open their eyes and hold their noses for a moment, when I say that \$10,000 a year is a common salary for the heads of these big tanneries, and that some men in America are getting over \$50,000 a year for their knowledge of leather and leather-making.

"More than all, the supply of men who know how to tan leather does not meet the demand by any means, and the top-notchers in the art and science of tanning practically dictate their own terms to their employers. These conditions are due to a perfectly natural development of currying and tanning in America, which has escaped the public eye.

"Fifteen or twenty years ago American shoemakers used to import great quantities of European leather, especially French kid. But the American tanners have so rapidly improved in leather-making, and so scientifically developed their processes of tanning, that they now supply the entire home demand for leather and ship millions of dollars' worth of their goods to Europe every year. The demand for brainy men in the tanneries comes from both American and European tanners.

"I saw lately a letter from a Warsaw tanner asking a manufacturer, known on both continents, to get him a practical American tanner. The Russian had sunk big sums of money trying to learn the American processes by experiment, and was willing to pay a good amount for a few months' instruction by a Yankee.

"Likewise, German manufacturers want American men who know how to tan, and a German manufacturer, who recently visited this country, is now building a factory to carry out American ideas.

"But the great demand for educated tanners is from the rapidly growing American firms. The young man desiring to learn the art (for fine tanning has become more than a commonplace industry) needs a good fundamental education, honesty and intelligence and ambition; otherwise no tanner wants him. A knowledge of chemistry is always desirable, but the tanner teaches practical chemistry. Almost any big concern will give a bright young man a place, providing he wants to learn the tanning, and will pay him good wages from the start. Once started the young man advances just as rapidly as he can absorb knowledge.

"He gets a splendid American education, for he meets all classes, from the capitalist to the Greek or Armenian in the tanyard, and he also notes the wonders of chemistry, and its process, directed by skilled hands, of converting the hairy hide into the handsome, silky-surfaced, finished leather. If the young man learns well and can make a leather just a little bit better than somebody else, than he can command his own salary."

How America's Commerce Is Spreading.

A RECENT writer in *Leslie's Weekly* prints this word picture of the condition of the American export trade, showing the popularity of our goods abroad: "The last railroad built in India has American rails. Americans export their iron and motors, their machinery and galvanic wires to South Africa. Egypt, too, has more than one Philadelphia (U. S. A.) bridge. Three hundred railroad cars from Jersey City (U. S. A.) have found their way into the land of the Pharaohs, and in the foundries of Pittsburg (U. S. A.) electrical tramways were forged to connect Cairo with the Pyramids. Is it wonderful that the American manufacturer and exporter should claim, like the American missionary, that he is the great torch-bearer of civilization? For, as we have shown, he is sending the products of his mill and factory into all Europe, and it may be added that his shipments extend to all the world. New Guinea, the Caroline Islands, Peru and Greenland send to him for sewing-machines. From all parts of Asia come orders for the handmaiden of commerce—the typewriter, with 'export keyboards' in Hebrew, Greek, Armenian and Arabian characters. That the Asiatic may sweeten his everlasting tea, immense quantities of condensed milk are shipped to Manchuria and Mongolia. From Moors and Persians come orders for bicycles, while Abyssinia wants American cameras. The great Atbara bridge, in the Uganda, in Africa, was built of American steel by American engineers. A tool shop in Sandusky, Ohio, U. S. A., recently filled an order from China for 20,000 planes. Far Australia calls for 20,000 tons of steel from an Illinois (U. S. A.) plant. Java has just bought a whole shipload of wire fencing. Japan absorbs everything American, from lamps to a complete railroad. Jerusalem orders Edison talking-machines and Kentucky whisky and Pennsylvania stogies. To the shores of the River Jordan itself the American manufacturer is now sending his agricultural machinery."

Egg-Boiling Machine.—The *American Inventor* announces the invention of a device for this purpose that is of more than ordinary interest. The mechanism consists of a clock with an adjustable pointer on a dial, connected to a small wire basket. The pointer is set for two, four or fifteen minutes, or whatever time is desired to be given to the cooking, and the eggs put in the basket, which is then lowered into boiling water. At the end of the time marked by the adjustable pointer the clock puts a train of gears in motion and lifts the little egg-basket from the water, thus stopping the cooking.

Windowless Building at the St. Louis Fair.

BELGIUM'S national pavilion at the American World's Fair is said to be the largest building in the world without a window. "This arrangement was deliberately planned," says Gustave Chartrain, the architect, "to secure an even distribution of softened sunlight. Windows let in a blinding blaze of light, whereas the intervals between them are dark. We have avoided this by omitting the windows and constructing the central section of the arched roof, extending the entire length of the building, of stained cathedral glass, which will let in abundant light."

The Belgian pavilion is 267 feet long and 191 feet wide. It is 55 feet high in the center of the great arched roof, and the great dome in the center is 100 feet high. The section of cathedral glass in the top of the roof is 20 feet wide. It is a yellowish-brown and the light cast through the interior of the structure is softened and increases the beauty of the interior furnishings and decorations. Great arched entrances on all sides make up for the absence of windows in the exterior appearance.

The pavilion is peculiar among World's Fair structures in other particulars. Most of it was shipped from Belgium, including all the heavy statuary and the paintings, in which the building is rich. A statue representing Belgium, which has a place over the main entrance, is that of a woman seated, her extended hands holding wreaths. The figure is 12 feet high. On pedestals at either side of the four entrances are life-sized statues representing the arts, sciences and industries. Great lions, which are used everywhere in Belgium for decoration, have places in the angles of the dome. A great crown rests on the top of the dome.

Paintings on the outside walls of the building depict scenes in the cities of Belgium, including Brussels, Antwerp and Bruges. The interior walls show the industrial and commercial life of the country. A royal salon is being elegantly fitted with furniture and tapestry from Belgium. Prince Albert, nephew and heir to King Leopold's throne, is expected to visit the Fair and the royal apartments will be reserved for his exclusive use.

An Age of Wonderful Achievement.

IN a recent address upon American progress Secretary Cortelyou, of the United States Department of Commerce, uttered these thoughtful words:

"This is an age of wonderful achievement. Progress and prosperity are all about us. In all lines of human endeavor this mighty young nation presses forward. From a weakling has developed a giant. From 3,000,000 we have grown to more than 80,000,000. From a few States on one ocean we have become a world power. From a few problems we have come to many problems—aye, and from a few dangers we have come to many dangers. When these things are realized to their fullest extent, thoughtful men and women who study the life of the republic will ask themselves in what direction they must look for the safeguards of the future.

"It is not necessary to be a pessimist to recognize evil tendencies and forbidding influences that menace the national welfare. We are not naturally a nation of pessimists. The founders of the nation breathed the very spirit of optimism, and, while recognizing that this Government, like all other human devices, had its imperfections, the great leaders of American thought and action from the days of Washington to the present moment have carried aloft the banner of a national hopefulness and have been sustained and strengthened by a firmly rooted belief in the integrity and greatness and glory of this mighty republic. Here in the heart of New England, speaking to the representatives of one of your great educational institutions, I emphasize again this fine American trait of hopefulness."

New Locomotive Beats All for Power and Speed.

DESIGNED to be the most powerful high-speed locomotive ever built, the New York Central's big Cole four-cylinder balance compound passenger locomotive is now being tested. The reports that have been received are very satisfactory. The four-cylinder Cole, which has no duplicate in the United States, is not so gigantic as the Baltimore and Ohio's big mountain-climber, or as powerful as the Atchison giants, but it could win from them any prize for speed, and was planned to drag a very heavy passenger train at a higher speed than any locomotive in existence.

This four-cylinder Cole is the pride of the American Locomotive Company. It was placed on exhibition some time this summer at the St. Louis Exposition. The engine weighs 200,000 pounds, and with its tender 321,600 pounds. Its total wheel base is 27 feet 9 inches. The locomotive has four cylinders, and the piston stroke is 26 inches. It has four driving-wheels of 79 inches in diameter. The tender carries ten tons of coal and 6,000 gallons of water.

Catalogues.—An elegantly got up machinery catalogue creates the impression that the man sending it out makes a mighty fine line of machines. This impression is usually correct, for it is a painstaking man that gets out such catalogues, and he generally takes pains in finishing all the details of his machines, too.—*The Woodworker*.

Labor-Saving Devices.—I am frequently asked for catalogues of labor-saving devices so much in use in the United States, and I would thank manufacturers if they would supply this demand, even if the catalogues are in the English language.—*Clarence Rice Slocum, United States Consul, Warsaw, Russia*.

How Big American Factory Pays Its Workmen.

IN an American town which contains the chief plant of one of the biggest manufacturing corporations of the country every Friday at 8 A. M. a policeman emerges from the door of a bank closely guarding three men who cross the sidewalk, enter a waiting carriage with bulky packages and are rapidly carried away, says the *New York Sun*. When the office of the corporation is reached, three or four workmen come forward and help the men in the carriage to carry the packages to the paymaster's department. There they dump bills, silver dollars, halves, quarters and cents to the amount of \$120,000 upon one of the tables. Then every one gets busy.

It is 8.15 o'clock by the big office clock, and that great pile of mixed money must be counted and verified to the last cent, and then be distributed into 10,000 envelopes in amounts of wide variation, and this must be accomplished by 2 o'clock. Coats and waistcoats are thrown aside, shirt sleeves rolled up and sixteen clerks jump to their places. There are four polished tables, each accommodating four clerks. The paymaster, who holds a memorandum of the contents of each of the money packages, throws a heavy bag of coin on a table. Instantly it is untied and eight hands pull piles of the coins toward them and the counting begins. At the other tables more coins or bills of various denominations are being counted. As each bag or package is completed, the paymaster checks it off on his list.

About an hour is consumed in this preliminary work. As the last bag is checked off the paymaster heaves a sigh of relief. The first stretch is passed; the amount is correct, and they can now get to the real work of the day. In front of the first man at each table are placed a pile of bills, with small change and a tray containing rows of pay envelopes. The hands in this factory are all numbered, and the envelopes bear on the outside the printed number and the amount due to that man.

The first man at each table seizes an envelope, rapidly counts out the money it calls for and passes both to his right-hand neighbor, who in turn counts it and passes it to the next man. He also counts it and passes it on to the fourth man, who packs it into the envelope. Thus each amount is counted three times, and the possibility of error almost eliminated. Silently and swiftly the sixteen men rush the work along, with an occasional brief pause to test a coin or pass a doubtful bill over to the chief for inspection, while now and then comes a sharp call for "more fives!" or "nickels here!"

Gradually the great piles of money diminish and the trays of filled envelopes pile up until at 2 or 2.30 a howl of relief, a stretching of tired arms and the stamping of cramped feet proclaim the end. Quick work this. Four men counted out 10,000 pay amounts in five hours. That means nearly ten each minute, and the amounts vary from \$2 or \$3 to \$20 and \$25, and call for all kinds of change.

But the paymaster is not through work yet. He has much yet to do, and not a superfluous minute to do it in. Hastily munching a sandwich, he counts over the money left and thus verifies the correctness of the amounts put up. If there's an error his troubles have just begun; but it is a remarkable fact that in five years, during which the sum of more than \$20,000,000 has been paid out in wages, only once has a recount been required.

Finding the account correct, he proceeds to make any reduction which may be necessary—purchases made by workmen, trustee writs and assignments to no-money-down concerns have to be taken care of—and with much groaning of spirit he calls an assistant to take out the required envelopes and help him to mark the deductions on them, and again makes the proper change.

It is 4 o'clock by the time this is straightened out, and preparations must at once be made for the final distribution of the pay. There are sixteen pay stations at various points in this great plant, and the pay envelopes must be properly deposited in heavy tin boxes for transportation to these stations. A clerk is in charge of each box, and it is now his duty to count the number of envelopes it contains and give a receipt to the paymaster.

At a quarter of 6, when sharp and clear rings the paymaster's voice, "Ready, boys!" the boys seize their hats, a heavy tramping is heard in the corridor, a score of stalwart "lumpers" troop in, and as the paymaster calls out "Factory A," "Factory B," and so on, the box for each station is picked up and carried off by a "lumper," followed by the proper pay clerk and an assistant. As the last box leaves the office the paymaster drops into a chair. He can have a twenty minutes' breathing spell now, the first for ten solid hours of intense care. The pay stations are simply boxes built at convenient points, large enough for the clerk, and containing a broad shelf for his money trays. A wire grating surrounds him, with an opening through which he can pass out the envelopes.

Unlocking his box, he arranges the contents on the shelf and his assistant stations himself just outside the opening. Already the men have begun to line up, and as the harsh screech of the 6 o'clock whistle breaks in above the rattle of machinery and clatter of feet the first man of the line hands his check to the assistant, who calls the number, takes the envelope, which is passed out, sees that it bears the corresponding number and passes it to the man, and the next check is instantly handled the same way.

All is systematic and orderly, and when a dozen or two men have passed and the line has struck its gait the work progresses so rapidly that the men do not halt in their progress. It becomes a steady stream of men walking past the station at a fair gait, and a steady stream of money passing into their hands, without error and without mischance.

The largest number of hands paid at any one station falls a little short of 800, and within twenty minutes from the time the first check is taken up the

last man is paid and the clerks are starting back to the office. Here they count over the checks they have received, add to them the envelopes they have not, for any cause, paid out, get the paymaster's initials to the last count, and at 6.30 all are out of the office, after a day of systematic expedition which would be a record-breaker if it was not of regular weekly occurrence.

An Enthusiastic View of Steam Turbines.

ARTHUR WARREN contributes to the *American Review of Reviews* a remarkably interesting article on the changes which the steam turbine is making in the engineering world. Mr. Warren's description of the turbine era is too exhaustive for our space, but readers who are interested in the subject will do well to secure a copy of the June issue of the *Review*. The scope of the article is slightly indicated in the following introduction:

"It is probable that the last great reciprocating engine-driven power plant has been ordered. Hereafter the steam turbine will be the prime mover of the new installations. The layman is apt to think that the turbine may possibly become the steam engine of the future. As a matter of fact, the turbine is emphatically the engine of the present time. 'It is not so young as it looks,' said a demonstrator, addressing a meeting of railroad men a little while ago. Its principles are as old as the hills, but modern methods of manufacture have only now made its mechanical construction and its commercial application thoroughly practicable.

"Most new things in mechanics come when we are ready for them. If the steam turbine had been perfected one hundred years ago, or fifty years ago, or twenty-five years ago, we would not have been ready for it. If we had the means to build it, we would not have had the means to apply it in general use. Electricity has given the means for its widest application—the commercial development of electric generating devices. The electrical necessities of the hour have forced ahead the development of the steam turbine.

"High-powered electrical generators had become so huge that they had almost reached the limits of practical construction and the limits of practical space. And the demand is for higher powers still. Speed and power here are closely related. The big generators were driven as fast as the monster reciprocating engines could drive them. When this point had been reached the gradually developed turbine was ready. With a turbine revolving at 750 revolutions per minute it is possible to obtain from a small electrical generator an amount of electrical energy heretofore given only by a machine many times its size.

"Behind all other forms of steam-engine practice lies the experience of a hundred years. Behind the steam turbine is the practical experience of twenty years. It is in its commercial importance that the steam turbine is new, and this importance dates from yesterday; that is to say, within half a dozen years."

1863-1903—Forty Years of American Progress.

To the Editor of THE AMERICAN EXPORTER:

From \$174,000,000 to \$873,000,000 in agricultural products exported.
 From \$41,000,000 to \$407,000,000 in manufactures exported.
 From \$6,000,000 to \$39,000,000 in mining products exported.
 From \$9,000,000 to \$58,000,000 in forest products exported.
 From 33,000,000 to 82,000,000 population.
 From \$17,000,000,000 to \$100,000,000,000 total national wealth.
 From 2,100,000 to 6,000,000 farms.
 From \$8,500,000,000 to \$22,000,000,000 total value of farm property.
 From \$1,500,000,000 to \$4,500,000,000 annual value of farm products.
 From 10,000,000 to 250,000,000 tons of coal produced annually.
 From a few thousand to over 10,000,000 tons of steel produced.
 From 23,000,000 to 2,900,000,000 gallons of petroleum produced.
 From less than 1,000,000 to over 14,000,000 tons of pig iron produced.
 From 7,500 to 275,000 tons of copper produced.
 From less than \$200,000,000 to nearly \$1,100,000,000 total worth of minerals produced.
 From less than 150,000 to 525,000 factories.
 From less than 1,500,000 to over 6,000,000 factory workers.
 From \$400,000,000 to over \$3,000,000,000 factory wages and salaries yearly.
 From \$2,000,000,000 to over \$14,000,000,000 in factory products yearly.
 From \$47,000,000 to \$82,000,000 worth of gold produced.
 From a few thousand dollars to over \$75,000,000 worth of silver produced.
 From 4,800,000 (1860) to 10,000,000 bales of cotton produced.
 From \$115,000,000 (1860) to nearly \$400,000,000 worth of cottons manufactured.
 From \$525 to \$1,300 national wealth per capita.
 From \$1,250,000,000 to \$2,500,000,000 total value of farm animals.
 From \$204,000,000 to \$1,025,000,000 total imports.
 From \$243,000,000 to \$1,420,000,000 total exports.
 From \$2,248,000,000 (1867) down to \$914,000,000 public debt.
 From \$146,000,000 (1866) down to \$25,000,000 annual interest charges.
 From \$4.12 (1866) down to 32 cents annual interest charge per capita.
 From \$25,000,000 to \$782,000,000 gold and silver in the Treasury.
 From \$595,000,000 to \$2,367,000,000 total money circulation.
 From a storm-tossed, war-swept, disunited country to a peaceful, progressive, glorious united Union.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices.

Our watch factory is the largest in the world devoted solely to manufacture of time-pieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify MILLS NOVELTY CO.'S COIN-OPERATING MACHINES, and to avoid errors, please mail us duplicate of order.

Mammoth Pictures Taken by Huge Camera.

TAKING pictures life-size is now possible in America through the development which has been made in this country in photography. Negatives 8 feet long and about 5 feet in width are made with the aid of a camera, which is undoubtedly the largest ever constructed. The idea of making such a camera was suggested in an attempt to produce a view of a train on an American railroad, and the first attempt to obtain a photograph was so successful that the locomotive and all of the cars were included on the plate.

Owing to its unusual dimensions the camera was built according to a special design, requiring nearly three months to complete. In the construction of the mammoth bellows over forty gallons of cement, two bolts of wide rubber cloth, and 500 feet of one-fourth-inch whitewood were used. The bellows is divided into four sections, and between each section is a supporting frame mounted on small wheels, which run on a steel track, the back, supporting the plateholder, being operated as easily as an ordinary camera.

As the plateholder, when loaded, weighs no less than 500 pounds, it really forms a separate portion of the camera, and is so large that it will accommodate a man, in addition to the plate. The light is shut out by means of a curtain, consisting of three thicknesses of opaque material fastened to a wooden framework. The curtain is attached to a ball-bearing roller in such a manner that the mere pressure of a button will roll it up rapidly as the ordinary window-curtain when the picture is to be taken.

When it is stated that ten gallons of cement and 80 square feet of ash-wood were required in make the framework, an idea of its dimensions can be gained. Owing to the size of the plate care must be exercised in freeing it from dust, otherwise an imperfect picture would be produced, so a novel plan is employed to remove the dust particles from its surface. In the rear of the holder is a door, which can be opened at any time as the curtain within protects the plate from the light. Providing himself with a camel's-hair duster, one of the "camera squad" enters the holder. Before rolling up the curtain, however, the cap of the lens is removed and one composed of ruby glass substituted, which allows sufficient light to penetrate the holder to clean the plate without difficulty. Then the curtain is rolled down, the ruby glass removed and the cap is replaced.

The word "squad" can be very appropriately used in connection with the camera, as it requires about twenty men to carry it and lift it into position, while it is provided with a special train when necessary to take views at a distance. Including the plateholder it weighs 1,400 pounds.

When the camera is adjusted for taking a picture, the photographer takes his place by the side of the lens, while an assistant prepares to operate the plateholder. When he is ready to make exposure, the photographer signals the assistant, who presses the button that controls the curtain-holder. Then the cap is removed from the lens in the same manner as when making an ordinary exposure, but the lenses are of such size that much more time is required than in ordinary photograph-making. One is of the wide angle type, having an equivalent focus of $5\frac{1}{2}$ feet, while another is provided of the rectilinear type, having 10 feet equivalent focus. On a clear day, when the sun is shining directly on the object to be photographed, an exposure of about two and a half minutes is sufficient to produce the image of an isochromatic plate. For an ordinary negative from one and a half to two minutes are required.

To develop the plate requires no little care, owing to its great size, and tanks have been made purposely to accommodate it while the developing solution prepared represents over a gallon of the liquid. The views which have been obtained, however, are considered by experts to be remarkably clear and brilliant, indicating that photography even on such a mammoth scale can be done successfully.

American Makes Photograph with Pitchblende.

A PHOTOGRAPHER of Minneapolis, Minn., U. S. A., recently made an interesting experiment with radio-active ore. A photograph was made from the light emitted by the ore, in a closed box, which excluded all other light. The resulting "shadowgraph" is similar to those made with the X-ray, and proves the strength of the light rays emitted by the ore.

The ore was brought to Minneapolis by E. P. Townsend, of Collinwood, who recently returned home, after several years spent in northern Colorado. The region is, so far as known, the only place in the United States where radio-active ore exists. It is found in two mines—the Wood mine, of which Mr. Townsend was formerly one of the lessees, and the Kirk mine.

The ore from which the photograph was made is pitchblende, containing 55 per cent. uranium. This ore is worth \$3.50 a pound. The ore holds considerable copper and other minerals, with a trace of gold. Radium is generally found in uranium-bearing ore. It is only within a few months, however, that the presence of radium in the ore from these mines was demonstrated by the investigations of a professor of the University of Colorado. Thus far no attempt has been made to extract the radium, but the companies operating the two mines plan to do so. The radium salts can be extracted without impairing the value of the ore for the extraction of other constituents.

The photographer who made the radium picture experimented several days in his efforts to obtain a good photograph. He first made the mistake of underestimating the amount of light emitted by the ore and gave the plate too long an exposure. This was a natural mistake, as the light from the pitchblende is not visible to the naked eye, even in the dark. The photograph

made was given forty-eight hours' exposure, and this was evidently too long for perfect results. In taking the photograph he laid a key and two coins on a dry plate, and then upon these a piece of ore, 4 inches long, 2 inches wide and a little more than an inch thick, weighing $1\frac{1}{4}$ pounds. He tried the experiment of printing from a negative by means of radium light, used as natural light, but found that the rays passed through the film and left no impression, acting similarly to X-rays.

New Electric Furnace Pleases Chemists.

HARMON V. MORSE, professor of analytical chemistry at Johns Hopkins University (U. S. A.) and adjunct director of the chemical laboratory, has perfected an electric furnace which, it is believed, will revolutionize practical laboratory work in chemistry. The furnace is the result of long and hard work on the part of Professor Morse, and his invention is one of the important scientific achievements of the year. Professor Morse's furnace was shown before the chemical seminary at a recent meeting at the university. He and his assistant, Dr. J. C. W. Frazer, were congratulated by President Remsen and the scientific faculty, to whom he spoke for an hour about the apparatus.

Heretofore gas has been the only source of heat for experimental work in the chemical laboratory. For a long time scientists have been trying to devise some sort of economical electric heater. That satisfactory results may be obtained in the heating necessary in laboratory practice four conditions must be satisfied: First, the heat must be developed economically; second, it must be possible to obtain definite temperatures; third, it must be possible to maintain constant temperatures for long periods; fourth, products of combustion must not be allowed to come in contact with the substances heated.

Chemists have long seen that the solution of this problem was to be found in the electric current, which yields no products of combustion, and can be developed at a constant and regular rate. Thus far, however, no one had been able to make it a practical substitute for gas.

Professor Morse's electric heater comprises, first, an ordinary copper oven incased in a box, doubly lined with asbestos, with an air space between, the whole covered with aluminum paint, which is not affected by high temperatures, is a very poor heat radiator and preserves the asbestos from shredding. This arrangement practically prevents any loss of heat by radiation.

The source of heat is in the stove placed within the copper oven. The stove is constructed of parallel slabs of soapstone coated with graphite, the soapstone being unaffected by heat. The graphite is evenly distributed over the slabs of soapstone that the heat may be developed uniformly over the surface. The use of soapstone in constructing the heater is the key to the apparatus.

The electric furnace has been found to work admirably, and can be operated at a cost of less than one cent a day. A constant temperature of 150 degrees can be obtained for eight hours at a cost of three-fourths of a cent. It is probable that Professor Morse's furnace will displace the old gas furnaces now in general use, and it is certain that it will add much to the exactness with which chemical processes may be carried out.

Germany's Railroad Show at the World's Fair.

OUR German cousins are well in evidence at the American World's Fair, and then we shall have occasion to mention some of the chief features of the displays which are attracting favorable notice. One of these is the German Government railroad exhibit, which shows the block system and switch signals now in use in Germany. More than 1,500 feet of track, in the construction of which both iron and wood ties were used, have been laid. There is a station-house, two switch-towers and one intermediate block-signal post. One of the switch-towers is fitted with mechanical and one with electric signal apparatus. The block system makes it impossible for a train to run into an open switch, or for one train to run down another between stations. The double-track system prevents collisions. By means of electrical apparatus all switches, except the one opening the desired track, are locked, making an error on the part of a switchman impossible. As the last wheel of the train passes, the switches are all released by rail contact, making way for the next train.

At intervals of about seven miles are placed intermediate block posts, with a similar signal and switch apparatus. By automatic arrangement the levers are all locked, so that one train cannot leave the station until the train ahead has passed the next post, thus preventing one train from running down another. All the material used in construction was brought from Germany.

American Leather and Shoes in Belgium.—United States Consul J. C. McNally, of Liege, Belgium, notes the importation of considerable quantities of American leather into Belgium, and says there is a constant demand for American shoes, concerning which he reports: "I find it impossible to secure a pair of fine American shoes either in Brussels or Liege. I would think that in such large cities an American shoe house would do a good business, as shoes of United States manufacture are acknowledged to be superior to all others."

Our Engines for Japan.—The Japanese Government has given to the American Westinghouse interests contracts for three large engines for shipment to Japan, where they are intended to be used in the power plants of ship-building yards and in one of the principal arsenals in that part of the world.

Results of the Oil Fuel Investigation.

NAVY officers of the United States have just concluded an interesting investigation into the usefulness of oil as fuel. Experiments began more than two years ago. The attention of the entire manufacturing, railroad and steamship world was arrested by the extravagant claims made for petroleum fuel. Its steam-producing quality was described as far greater than that of coal. Boiler manufacturers were invited to submit boilers for the test of oil fuel. Many inventors of burners especially adapted for oil consumption installed their burners in turn at the plant established in this city.

The first year was devoted to a series of experiments with coal. Data as to the steam-producing ability of coal and its effect upon the boilers were obtained and proved of great value in comparison with the results of the oil tests the following year. Commercial interests all over the United States sent experts to observe the progress of the tests. Railroads, especially those operating through countries rich in oil, were anxious for information. Coal men watched these experiments with anxiety, inspired by tales of the coming overthrow of coal by oil for marine and mercantile purposes.

The naval side of the problem was given careful attention, the question of stowing oil on warships in such manner as to prevent explosions from the gases generated proving a complicated problem. The combined expenditures of the Navy Department and manufacturing interests in connection with the experiments aggregated \$250,000.

While the report deals largely with the military and marine features of the oil fuel problem, enough is known of its character to warrant the statement that the industrial and manufacturing interests of the world will receive the most important and immediate benefits from publication.

Because of the great importance which Rear-Admiral Melville and other naval officers attach to this report it is believed the experiments will finally result in great changes in mechanical establishments in the line of economy. The fuel problem is one that concerns the relative naval strength of the United States, and this feature has received special consideration in the report.

Inventive minds have been at work for more than twenty years trying to discover methods by which petroleum oil might be used as fuel, but up to the present time no device has been offered by which it could safely be used at a cost below that of coal.

The anthracite coal strike in 1902 brought out an unusual number of patents, but none has come into general use. During that year the Patent-Office was overwhelmed with applicants in that particular line, and before the coal strike was settled more than 1,300 patents for liquid fuel burners had been granted. Many more have been granted since.

A board of naval officers began exhaustive experiments with oil fuel in 1900. Tests were made of Texas, Pennsylvania and California oils, and it was decided that the California oil contained the greatest heating qualities. Experiments were made on various large and small vessels of the navy, and, while none of these has demonstrated that oil can be used as a substitute for coal, great advance has been made and a great service has been rendered to the merchant marine.

There are many records of long voyages made with the exclusive use of oil as fuel. One British ship covered 12,000 miles in 1902 with 800 tons of liquid fuel, and in some of the torpedo-boats in the American navy oil is now being used.

There are two main plans for all the oil burners. One is a device for mixing it with steam and the other for turning it into vapor. The principal drawback of all the systems has been too elaborate and expensive apparatus.

Oil was used in many factories where coal could not be obtained during the coal strike in 1902. Up to that year insurance companies had always inserted a clause in their policies prohibiting the use of oil for fuel, but so great became the demand for the privilege to test oil fuel that this clause was left out of new policies.

Ingenuity of Our Die-Cutting Machinists

AN interesting story is told in the *New York Press*, which shows the progress made in one branch of American industry, and in a fashion discloses our methods. It seems that a few days ago a young man with a love for making bets stepped into a design-cutting plant.

"I'll bet you a dinner," he said to a friend who had charge of the die-cutting machines, "that you can't reproduce that on steel with one of your machines and make it one-quarter the size it is now." He picked up a bronze campaign medal about two inches in diameter. The medal was one of many varieties seen at the time of the last Presidential campaign. It contained etched and in relief around the outer borders the busts and heads of all the Presidents of the United States. In the center was the engraved representation of the bust of President McKinley.

The medal was fastened on the machine, the wheels were set revolving, and in about eight hours of actual grinding the medal had been reproduced on a steel die less than one-eighth of an inch in diameter. It was so small that the design on it could not be distinguished without the aid of a powerful microscope; but under the lense the heads and expressions on the faces were seen to be perfect reproductions of the designs on the original medal.

All the big American silverware manufacturers now make their designs by these machines. A set of toilet articles richly backed with silver decorations in high relief gets its beauty from the freedom with which the designer is allowed to work by reason of the die machines. Hand-mirror backs,

match-safes, silver penknife handles and a great variety of other relief-stamped silverware is made from a die turned out by machinery.

A remarkable story is told about the work of the die machine in bringing the bronze and metal reliefs of the seal of New York State up to its present high standard of beauty, grace and art. A young man who was employed as traveling salesman for a large silverware concern came in from the road one day, kicking strenuously about some of the designs in his sample-case.

"See here," he said to the head of the house, "this is supposed to be a reproduction of the seal of New York State." He held up a silver disk about four inches in diameter, mounted in a dark-stained wood frame. "It doesn't look enough like a seal to be called one. Look at these lines—stiff, cramped, ugly. I can't sell pudgy designs like that."

"Well, what are you going to do?" asked the head of the house.

"Do?" replied the salesman. "Why, make the die by the reducing machine. Get the seal made in a large bronze casting and reduce it to a small die on the machine."

They did it. They have been doing it ever since. Other houses took up the idea. Gradually the cramped, stiff designs began to disappear from the market. They had to. Thus the seal of the State of New York as it now appears in the majority of metal decorations is one of the best executed and handsomest seals of any State in the Union.

Uses for Wireless Telegraphy in Farming.

WIRELESS telegraphy is applicable to various agricultural purposes, says a writer in *Electricity*. First, it is natural that it would be used by farms or isolated distant villages as a means of intercommunication, or communicating with market cities. It might also be used to accomplish vast results by furnishing information of every character to help out agriculturists in their work and in their commercial transactions. There was the objection to be met from the start—specialists were needed. They were needed, but they are no longer required. It suffices to set up a transmitter provided with a wheel, on which the dispatch is "composed," having a double row of characters, one row containing ordinary letters, the other, the equivalent of the Morse code. When the despatch is composed it is transmitted automatically by tripping a clockwork mechanism. This device is objectionable, from the fact that the message is received in Morse characters, but if this be a real hindrance, it is only necessary to use the device which prints in ordinary characters. The two other applications for wireless telegraphy to agriculture consists of something further than the transmission of messages. Its first purpose is to prevent frosts. In certain sections of France frost sometimes entails losses of from \$5,000,000 to \$8,000,000 a year. A company in Paris installs a central station provided with a thermometer and a wireless telegraph transmitter, so arranged that when the thermometer falls rapidly during the night under a cloudless sky an alarm-bell is made to ring, which notifies the station watchman. It is then only necessary for him to operate the transmitter which governs a series of radiating conducting circuits. When these circuits are closed fire is started under combustible materials which have been prepared in advance. These fires are simultaneously started at a large number of places; artificial clouds are thus formed, which serve as protective blankets for vegetation. It would be very easy to amend this method by tripping a switch by means of the thermometer, causing a spark by a circuit through a coil and kindling the fire by means of a little powder. Wireless telegraphy is also used to warn farmers in advance of coming storms.

An Automatic Milking-Machine to Be Tested.

IS the automatic milking-machine to be added to the cream-separator as an important extension of the line of goods sold by the American farm-implement trade? Numerous attempts have been made by ambitious inventors in the past to design an apparatus to take the place of the dainty milkmaid of the poets of a generation or two ago and the present-day unpoetical hired man, but they were all of the Darius Green order of practicability, and are as dead to fame as the names of their hopeful inventors. However, now comes a cow-milker company with a proposition to the Minnesota State Dairy Commission, offering to install such a machine for a test of six weeks or two months. Commissioner McConnell, while said to be favorably impressed with the apparatus, has not yet decided to approve it, but will probably give it the benefit of a State test in one of the dairies near Minneapolis, U. S. A. The machine is operated by a gasoline engine by means of an exhaust pump and vacuum. The inventor claims that it will perform the work of six men, or, in other words, that with one man to operate it, six cows can be milked at the same time, and the work performed more rapidly and more thoroughly than by hand. If it should prove to be successful in its working and entirely agreeable to the cows, the machine will not only open up vast possibilities for the implement men in connection with their present rapidly growing trade in separators and other farm dairy appliances, and for the dairy farmers themselves, but its general introduction will undoubtedly prove a potent factor in solving that much-mooted problem, how to keep the boy on the farm. For, unless the average farmer boy differs materially from the writer when he was a boy on the farm, the inevitable milking time is one of the strongest incentives to fire a boy with an ambition to abandon the healthful, honest and profitable life of a farmer, and to fly to ills he knows not of which lurk within the delusive and disappointing walls of the city. The world will watch with interest the progress of the automatic milking-machine.—*Texas Trade Review*. Our readers will be advised of the results of the tests.

"IDEAL" Steam Cookers

FREE Book of 36 pages, printed in colors; handsomely illustrated; tells all there is to know about steam cookers—round or square. The 1904 models of "Ideal" Steam Cookers are entirely new in principle, design and special features. The only steam cookers made in which both round and square have whistles to call the cook when water is needed. Seamless copper tank bottoms. Cooks a whole meal over one burner, on gasoline, oil, gas or common cook stove. Reduces fuel bills one-half. Agents wanted.

We Want Foreign Agents, and to get them quickly, we are making the following liberal proposition for this month:

No. 20, Sq. Copper Tank	No. 6 Round Cooker
Retails \$6.50 Each.	Retails \$5.00
13-gallon food capacity. 12 Cookers in a box. Measurements and weights of boxes holding 12:	10-gallon capacity. 12 Cookers in a box, nested, solid. Measurements and weights, 12 in a box:
Gross weight, 210 lbs.	Gross weight, 150 lbs.
Net weight, 144 lbs.	Net weight, 120 lbs.
Cubic feet in 12—28.	Cubic feet in 12—11 1/2.
\$39 doz., f. o. b. N. Y.	\$33 doz., f. o. b. N. Y.

These are our best sellers, but we make thirty different sizes of Cookers. Boxed ready for steamer. Order direct or through export house; in latter case, best duplicate order to us to avoid errors.

We manufacture a full line of Kitchen Specialties and Blue-Flame Wickless Oil Stoves.

To Telegraph Sixteen Messages on One Wire.

TO telegraph sixteen messages simultaneously over a single wire has now been made possible through an invention of Dr. Michael I. Pupin, professor of electro-mechanics in Columbia University, New York City. When asked by a reporter if there could be any doubt as to the commercial practicability of his device, Dr. Pupin replied: "Absolutely none whatever."

Probably the largest of a telegraph company's items of expense are those incurred in the installation and maintenance of wires, and if one, with Dr. Pupin's system, can be made to do the work of sixteen under old-time methods the saving in expense should be great. Heretofore the maintenance of four circuits on one wire has been the limit of the multiplex machines invented. An octoplex machine was set up by the Western Union company, but it could not be operated successfully. Duplex and quadruplex systems now are in use by the two chief American companies, but Dr. Pupin's device, in addition to permitting of the maintenance of a much larger number of circuits, is understood to have a great advantage over them in point of simplicity.

The Pupin system differs chiefly from the multiplex systems now in use in that it operates with an alternating instead of a direct current. It might be described as a system of tuning, the principle being the same as that which underlies all the wireless telegraph plants. The idea originated with Dr. Pupin. As early as 1894 he patented a general system of tuning as applied to telegraph operations, and when Marconi began his wireless experiments in 1896 he had to purchase the right to its use from the Columbia professor, as every other inventor working in the wireless field has had to do since.

Dr. Pupin devised his multiplex machine in the laboratory of Columbia University, and there is a model of it now on view in the lecture room of Havemeyer Hall, where he recently explained its workings before the New York Electrical Society. Attached to the generator are devices for giving out alternating currents of various frequencies. Instead of the current passing directly along the wire, as is the case with the ordinary telegraph system, these devices cause it to proceed in undulations, or waves.

The frequency of the waves has reference to the number that are formed a second. The model at Columbia University forms alternating currents of only six different frequencies, and therefore will admit of the transmission of only six messages simultaneously, but the inventor says that by the addition of the necessary parts to the machines it is just as easy to transmit sixteen as six. If sixteen circuits are to be operated the machine will make it possible for sixteen currents, each vibrating in waves of distinctive lengths, to pass along the wire at once, and when they reach their destination they will find waiting for them sixteen receivers, each tuned to respond to one set of vibrations and no other.

If a piano is left open and on a violin a note is struck that is of the same pitch as one of the strings in the piano, the piano string will vibrate in sympathy, and the same principle exactly governs Dr. Pupin's system of telegraph tuning. In other words, each receiver is electrically tuned to respond to a certain pitch, and in this way the various currents passing, superimposed upon one another, along the wire are separated and diverted to various sounders, the ordinary Morse sounder as well as key being used.

Dr. Pupin's device is the first wire telegraph system to make use of alternating currents for long distances, the theory having been that it would not work for a greater distance than 200 miles. His invention has the great merit of "rectifying" the current before it reaches the sounder—that is, the alternating current is passed through a machine which changes it into a direct current and thus greatly increases the distinctiveness of the signals.

It is expected by Dr. Pupin that his system will permit of the use of a smaller wire, and thus further reduce the expense of telegraph operations, but he said last month that this possibility had not as yet been demonstrated. The model now at Columbia University is to be sent to the St. Louis Exposition, where it will be on view in the pavilion of the United States Patent-Office. It is, of course, impossible in the case of a model to stretch more than a few feet of wire between the transmitters and the receivers, but in the center of the line Dr. Pupin has a device which makes it equal in capacity, inductance and resistance to 400 miles of wire, so that the workings of the system over a long distance can be demonstrated practically.

New Uses in America for the Telephone.

CLEARLY and sweetly the words of the famous old hymn, "How firm a foundation," came to the ears of the patients in the Samaritan Hospital, Philadelphia, U. S. A., on a recent Sunday. Dr. Russell Conwell had caused the hospital to be connected with the Baptist Temple, in that city, by means of telephones, and, with megaphones strung in front of the pulpit and receivers in the hospital wards, the singing of the chorus and the words of the sermon were distinctly heard by the patients.

The telephone company undertook the contract to place telephones in all the wards of the Samaritan Hospital, of which Dr. Conwell is the president, and to hang a string of megaphones in front of the platform at the church. For those patients who were too weak to hold the receiver to the ear head attachments were provided, so that without the slightest exertion on their part the services of the temple could be heard almost as plainly as though they occupied seats in the church. The voice of the preacher came strongly and clearly over the wire, every word caught by the megaphones and carried to the delighted patients at the hospital. The singing to the accompaniment of the great organ was so realistically close to the ears of the hospital inmates

that many joined involuntarily in the exercises, scarcely realizing that they were a long distance from the scene of the services.

Another innovation in telephonic usage is the communication between conductor and engine-driver on moving trains and the connection of the train with business houses in places where a temporary stop is made, so that passengers may talk to friends or customers without the necessity of leaving the train at all. This idea, tried as an experiment on a Western road and successfully carried out in course of a recent trip of officials of the Pennsylvania Railroad, promises to come into general use on the railroads of the country.

The advantage of telephonic means of conversing with the engineer in his cab, instead of reaching him by a slow and ponderous system of signals, is too obvious to need comment. The great advantage that will appeal to the general public is the possibility of saving time by telephoning from the train to business or private houses when the cars are at a standstill in stations along the line. Thus, a commercial traveler who has only a few connections in a small town and thinks he can do better by going straight on to the next, but still desires to give his customers a chance to know of his presence, can do so by having the car telephone switched on to the office telephones. While the engineer is using his oil-cans in the front of the train the passengers may be talking to their business friends in the town. If it seems best to alight and stop over night the commercial men may then do so. If it appears to be only a waste of time the trip may be continued to the next town.

Still another new idea in telephone business is the calling of early toilers and those who wish to catch trains in the small hours. There is no alarm-clock to beat the telephone, for it continues ringing until the sleepy one gets out of bed and stills its voice by removing the receiver from the hook. Then the operator knows that his duty is done and stops ringing. One of the telephone companies has found this branch of business so profitable that a regular department has been organized for the express purpose of calling customers in the morning. A telephone of the ordinary kind is placed at the bedside, and the simple process of "calling" is to keep ringing at the hour agreed until the response shows that the alarm has served its purpose.—*New York Tribune*.

Radio Vibrator Has Great Possibilities.

AN American invention which, it is asserted, may revolutionize medical science and throw into insignificance such discoveries as radium and the X-ray, has been brought to completion in the laboratories of the Minnesota State University, at Minneapolis, U. S. A., by Warren F. Bleeker.

For years Mr. Bleeker has worked on his invention, which he calls the radio vibrator. For the last three months he has worked in the laboratory of Professor Hubert C. Carel, professor of chemistry at the university.

The instrument is based on the theory that the elements of the human body, when the body is in perfect health, vibrate in perfect harmony. When the body is in a diseased condition this normal tone is destroyed. By the therapeutical application of the radio vibrator, it is declared, the deranged tone of the body may be restored to a normal condition. The inventor does not claim for his instrument all curative power, but by actual trials remarkable results are said to have been accomplished in curing nervous diseases.

The radio vibrator is a small, nickel-plated metal box about 4 inches long, 3 inches wide and 1 inch in thickness. From one end two wires about 4 feet long extend. These wires terminate in small circular disks, which are applied to the affected parts of the body. The box contains a mysterious compound of chemicals known only to Mr. Bleeker and his assistants. The vibrations of the chemicals within the box are transmitted by means of the wires and disks to the human body. As soon as applied the action of the chemicals within the box is calculated to cause sympathetic normal vibrations in the diseased body, thus restoring the patient to health.

Energy in the Ocean.—Few people realize the tremendous power running to waste in the unharnessed waves of the ocean. According to the *Manufacturer*: "Given a wave, 40 feet high from trough to crest, it will have a width, from wave to wave, of 200 feet. That wave weighs 60,000 pounds for each foot of its length. That means 130 tons a foot. Let the wave travel at a velocity of 35 miles an hour, and that wave a mile long will develop in one second energy equal to the power generated by burning 1,250 pounds of coal. Take another view of it, and the figures show that an hour of the wave's energy, if transmitted into heat, will be sufficient to raise 604,000 gallons of water from the freezing point to the boiling point." This is all very interesting, but it is impracticable, from a commercial point of view.

Italy Needs American Electrical Machinery.—Advices received at Washington are to the effect that there is room in Italy for the importation of American electrical machinery, in spite of the many existing local shops. The report says: "The United States being far ahead of any other country in the matter of inventions and labor-saving machinery, American machine manufacturers would undoubtedly be able to create a market in Italy for their productions, especially in the line of machinery in connection with the utilization of the great water power of Italy." Electrical machinery to the value of \$60,592 was shipped from the United States to Italy during the fiscal year 1903.

American Equipment for Kolar Gold Fields.—The Mysore Government, India, has placed contracts with the General Electric Company for five large electric generators for the Cauvery Falls generating station, which furnishes power for transmission to the Kolar gold fields.

De Laval Cream Separators.

Immediate and absolutely complete separation of cream from milk by machinery.

500,000 Machines in Use throughout the Dairy World.

A saving of 10 to 25 per cent. in any climate, and 25 to 100 per cent. in warm countries.

Great Engineering Feats of American Railways.

THE reclamation of the China Basin in San Francisco, on the Pacific coast of the United States, and its transformation into modern railway terminals is another engineering project of magnitude and boldness undertaken by the Atchison, Topeka and Santa Fé Railroad management. The tract selected for the terminal development comprises fifty-four acres, and was from 4 to 15 feet below tidewater. The railroad wishes to overcome its handicap in the matter of station and yard facilities, and will spend \$2,000,000 to be next the new yards of a competitor.

Engineers' soundings found a depth of mud of from 40 to 150 feet in the China Basin, and a sea wall of solid rock must be built nearly a mile long and 200 feet wide on the top. At least 2,000,000 tons of rock will be needed to fill in the treacherous basin bottom. The basin is being reclaimed by three huge steam shovels, removing 3,000 cubic yards of earth daily from an adjoining hill to the basin. Twenty cars and seven locomotives help the shovels, and a big plow pushed by a 75-ton locomotive does the work of 100 men in scalping the adjoining hill, which is to be improved by the company as a part of the operation.

The completion of the "Ogden Cut-Off" of the Central Pacific is a triumph over combative nature in the history of American railroad construction. It has been a battle between engineers with millions of money behind them and what seemed to be a bottomless Great Salt Lake. Within a short time transcontinental passengers will ride directly across the lake, a distance of 170 miles, and President Harriman, who has decided to be on board the first train, will be entitled to the privilege by virtue of the \$4,000,000 which this single piece of construction has cost his railroad.

The work was begun nearly two years ago, and unexpected obstacles were encountered from the start. Piling dropped into the earth, as if poked through a crust; mountains of earth dumped by train-loads vanished overnight, and temporary tracks simply fell in and could not be found. Now and then the engineers thought they had gained the day; tracks were laid after prodigious labor and trains run over them. Suddenly the lake would swallow embankments, trains and their crews. The engineers believe they have at last fought their way to solid foundation, but they are still filling in and bracing their trestlework, and they will not risk a regular train service until the work has stood severe tests.

When the new line is opened thirty-nine miles in distance will be saved and between two and three hours in time. Every train over the line will help pay for the cost of the "cut-off." "Helper" engines will be discarded, less coal used, fewer switchmen, telegraph operators and section men employed, and train crews who are paid by their mileage will receive smaller wages. These and a hundred other savings are reckoned with in the economic justification of such railroad improvements as these.

The precedent set by the Central Pacific is likely to be followed by the Western Pacific, the new road building between Salt Lake and San Francisco, and a route has been surveyed across the southern end of the lake, where forewarning prompted a successful search for firmer foundation.—*Collier's Weekly*.

Care of America's Greatest Railroad Tunnel.

H OOSAC TUNNEL, the largest in this country and one of the greatest in the world, was the subject of an article in the recent issue of the *Boston Globe*, which gave some interesting information. The tunnel, with its double tracks for eastbound and westbound trains, is a part of the Boston and Maine system, and is nearly five miles long. It cost the American State of Massachusetts about \$20,000,000, but it has brought much more than that to the people who paid for its construction.

In the care of this great tunnel, so that the lives of passengers and train crews and workmen shall be safe, unusual conditions have been met and overcome. At one time it was lighted with incandescent electric lamps. The expense was large for putting in the system, and it amounted to little, practically, except in the way of advertising. The electric lights did not enable the workmen to labor without other artificial lights, or the travelers to see the sides, and the gases and dampness so interfered with the wires that the system was discontinued.

Two section gangs of eight men each are constantly employed in general trackwork. Seven men are employed as miners, as they are called, whose duty it is to work on the brick and rock overhead and see that everything is safe. In the winter season thirty-five extra men are hired, as their services are needed for "housecleaning," or whatever else may be necessary.

Then there are trackwalkers, one at each end of the tunnel, who walk from the portals to the central shaft twice each day, and two other men who do the same thing at night. There are signal lights to every 6,000 feet. Near the central shaft, on the south side of the eastbound tracks, there are two signal lights west of the shaft. On the north side of the tracks westbound are two signal lights east of the shaft. All these lights give the trainmen and workers their bearings.

At the west end of the tunnel there are great doors, with small ones in them for workmen, which are opened and closed by men whose special care it is to tend them. The doors are for the purpose of preventing the frost from playing havoc with the brickwork inside during the winter time. Few people know that at the entrances, when the small doors are opened, there is at times a tremendous suction, almost enough to throw a man off his feet.

A suction of this kind, with the mercury many degrees below zero, means intense cold. Indeed, within the tunnel, two large furnaces are kept at work, coke being burned.

Some idea of the climatic changes can be obtained by saying that after going in many hundred feet great icicles can be found, while at the central shaft the temperature is from 40 to 50 degrees above zero in the winter time and about 70 above in the summer.

How is it that trains can be run safely, and that men can work without danger in the tunnel? In the first place, there is a block-signal system that prevents more than a certain number of trains in the tunnel. Then the tracks are locked and more trains cannot enter. This number is two passenger trains going in opposite directions. Freight trains are never allowed in the tunnel at the same time with passenger trains. There are signal stations at each end, and it is not possible for trains to enter until permission is given.

Then there is a perfect telephone system in the tunnel. There are a number of stations, and there are ways so that the workmen can attach instruments and converse over the wires when necessity requires without going to a station. On account of dampness it is necessary to keep a lighted lamp inside each telephone box, so that the heat will keep the temperature right for the instrument.

When new rails are being laid, or the construction work is more than simple repairs, it is done at a time when there is little traffic, and for the few hours necessary only a single track is used, the men working on the other. Of course, at such a time the block system is looked after with a greater closeness, and only a single train is allowed in the tunnel at a time. There are crossovers for trains at each end. The life of steel rails inside the tunnel is only five or six years, about half of the time outside. In others words, the gases and other substances are fatal to steel, but preserving for wood.

One of the most interesting operations inside the tunnel is the yearly housecleaning. This is always done in the winter, when there is less outside work. Preparatory work is done during the week, and then on Sunday nights, when traffic is light, the sand, coal sparks, cinders, soot, rock, ties, etc., are taken out in great double drop side cars, which have a great capacity. Some one has been romancing to the effect that so much soot gathers in the tunnel that it is necessary to use long poles with scrapers and brooms to get it off from the sides and tops. Foreman Byrnes says this is not so. The sides and top are reasonably clean, he says. The accumulations come from the sand-boxes on the engines, cinders and coal, loose rock which has been taken down, and old ties which have worn out.

About fifty men were employed this year in housecleaning, and the record of debris taken out and the number of feet cleaned was as follows: November 22d, nine cars, 2,300 feet; November 29th, eight cars, 2,200 feet; December 6th, ten cars, 3,700 feet; December 13th, ten cars, 3,900 feet; December 20th, nine cars, 2,700 feet; December 27th, seven cars, 2,500 feet; January 3d, ten cars, 3,900 feet; January 10th, seventeen cars, 2,600 feet—a total of eighty carloads and 25,031 feet, the length of the tunnel. About 75,400 cubic feet of dirt were taken out and dumped west of Williamstown, where grading was needed. Once a year is often enough for doing this work. Foreman Byrnes and his men take as much pride in keeping the great tunnel neat and in order as does the most careful housekeeper.

Oil-burning engines are being used to a certain extent in order to avoid smoke and gas. In other words, the regular coal-burning engines do little of the work going through the tunnel when an oil-burner has been attached in the yard.

The time of trains running through the nearly five miles is from seven to ten minutes for passenger trains and from twelve to fifteen for freight trains.

On top of the mountain is a great revolving fan, operated by electricity generated in North Adams, about five miles away, requiring the services of two men. It is only operated during ten hours of the daytime. This great fan, 16 by 18 feet, assists the natural draught in sucking the smoke and gas from the tunnel. It cost a bit of money to put it in, and it costs to maintain it. It greatly assists, particularly in the summer, in clearing the tunnel of smoke and gas. No passenger has ever lost his life in the tunnel since it was opened twenty-nine years ago.

American Furniture Industry.—The increasing popularity of American furniture abroad will make this item from the *World's Work* of interest to our readers: "Grand Rapids, Mich., U. S. A., gradually acquired the bulk of the manufacturing business, until now it has practically no competitor. There are 10,000 skilled woodworkers in its forty factories, the value of whose annual output is about \$12,000,000. Great quantities of mahogany are imported from Cuba, Santo Domingo, Central America and Africa, and in many houses in this city entrances and even porches are built of rare woods. Skilled designers, employed by manufacturers in other cities, live in Grand Rapids, in order to work in a furniture atmosphere." It may be added that considerable quantities of the imported woods are sent back to whence they came, after having been transformed into shapely and salable articles of American furniture.

American Pianos Wanted in Brazil.—Louis H. Aymé, United States Consul, Para, Brazil, reports that there appears to be a market in his district for a good cabinet piano if it fulfils the following requirements: It must be an upright piano, purchasable at Para at from \$500 to \$750. It should be put together, as far as possible, with screws, or, at least, not with glue; it should possess a rich, full tone, which should be permanent, not becoming "tinny," and it must be able to withstand a very hot and very damp climate.

Develop Your Mineral Resources

THE PORTABLE STAR DRILLING MACHINE

is especially designed for drilling oil or gas wells, water wells and mineral prospecting. Every machine is complete, and is so built as not to break or get out of order, being made to operate ENTIRELY WITHOUT SPRINGS.

F. S. Gilbert, Cleveland, Ohio, writes: "I have frequently drilled 100 feet in 24 hours with my Star. It will doubtless make possible, in time, the cultivation of the arid western desert."

John Calkins, Newton Falls, Ohio, writes: "Have two of your Star Drilling Machines, and they take the lead of all others. I have drilled 76 ft. in 10 hours, 64 ft. of it in rock."

**Star Drilling Machines are made in Ten Sizes.
Will Drill 250 to 2500 Feet.**

They are the very best machines on the market. We also manufacture Drilling and Fishing Tools.

Send for our illustrated catalogue.

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is \$30, delivered New York City.

G. W. TODD & CO., Mfrs., 40 Trust Bldg., Rochester, N. Y., U. S. A.

EXCLUSIVE AGENCIES GIVEN.

Orders executed either direct or through export commission houses.

GOULD'S STEAM AND WATER PACKING.

ORIGINAL RING PACKING.

Patented June 1, 1880.—The Original Ring Packing.

IN ORDERING, GIVE EXACT DIAMETER OF STUFFING BOX AND PISTON ROD OR VALVE STEM SELF-LUBRICATING, STEAM AND WATER TIGHT.

Less friction than any other known Packing. Never grows hard if directions are followed. Does not corrode the rod. EVERY PACKING FULLY WARRANTED.
N. B.—This packing will be sent to any address, and if not satisfactory after a trial of 30 days, can be returned at our expense. None genuine without this trademark and date of patent stamped on wrapper. All similar packings are imitations and calculated to deceive.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest Medals: Gold, Silver and Bronze.

Excels on Every Point. Cheapest to Use in the End.

TESTIMONIAL.

NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,

(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

"NEW JERSEY" COPPER PAINT

LEADS THEM ALL,

So Our Testimonials Say.

We guarantee this Copper Paint to be the easiest to apply and, owing to its being so finely ground, it is the smoothest paint in the market.

Highest Medals from National Export Exposition and American Institute, New York City.

New Jersey Yacht Red Copper

For Yachts. Brightest Color Made.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J. U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water. MILLS EDWARD, Master Schooner "Florence Shay."

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing,
Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering apparatus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, so that prompt delivery can be made.

**FIRE EXTINGUISHERS,
CHEMICAL ENGINES,
TRUCKS,**

For Storehouses, Homes,
Factories, Establishments
or Fire Departments.

Please pay us a visit when you come
to the Exposition in 1904.

When the apparatus is loaded it will throw a stream of gas (which gas is the best fire extinguisher) at the distance of 50 feet. Any woman or child can operate it as well as an expert man. It is always charged and ready for use, but it has no pressure until the moment of using. Once discharged or used it can be charged again in one minute.

pressure until the moment of using. Once discharged or used it can be charged again in one minute.

STEMPEL FIRE EXTINGUISHER MFG. CO., St. Louis, Mo., U. S. A.

The Tucker Alarm Cash Till.

A perfect day safe. The act of closing locks the till. Over one million now in constant use. No key to be lost. Susceptible of 32 changes. Opens like a common drawer. A terror to sneak thieves. Handsomely finished in walnut, oak or cherry woods. Varnished and polished.

As a piece of cabinet work, well worth its cost.

Sounds the alarm promptly if tampered with. Delivered (1/2 doz. in a case) free to vessel. Catalogues in English and Spanish.

"FOR THOSE WHO WANT THE BEST."

Fiberlite Shade and Holder.

Shade made from fiber similar to that used for lining sockets. Mottled green on outside and pearl gray inside. Fiber finished under pressure which gives it a gloss finish, furnishing fine reflection for light. So tough that edges will not break and so springy that it cannot crush. Holder of heavy wire; one piece, clamps to socket with a catch. One catch and no screws. Fastens to inside of shade and any tendency to pull off only makes it hold more securely.

Light as aluminum shades, which means cheap freight rates.

TO INTRODUCE ABROAD:

Upon receipt of \$40.00 in U.S. gold or its equivalent, we will box and deliver f. o. b. cars at New York, five gross of these shades in assorted sizes.

CINCINNATI, OHIO, U. S. A.

VAN BIBBER'S "ROUGH AND READY" ("El Tosco y Listo").
PRINTERS' ROLLERS
For ANY climate, hot or cold, can be made at once by any printer. You can make the best rollers, as hard or as soft as you please. No roller can be better. "Rough and Ready" does not spoil from age. English and Spanish directions. Price, 35c. List per pound, 77c. List per kilo, f. o. b. New York. Being an unfinished composition, the rollers when made cost less than this. Send to us for pamphlet. Used since 1878. We are manufacturers who sell at first hand and invite correspondence from prominent foreign dealers, to whom we offer special inducements; or, if you prefer, order through Amsinck & Co., American Trading Co. or any other responsible New York exporter.

TANITE
GRINDING MACHINES. EMERY WHEELS. EMERY.
The Tanite Co., Stroudsburg, Penna., U.S.A.
You can buy to advantage through any American Export House—preferably in New York City.

A HATCHING WONDER
The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17½ inches; weight, 12 lbs. Net price, \$5.00. For full particulars address
CYCLE HATCHER CO., Salem, N. Y., U. S. A.

OUT-HATCHES ITS COMPETITORS!
Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.
Reliable Incubators
have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage
RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

Gem Incubators
Are low in price, but this does not mean that they are cheaply made, or that they are inferior in any way. In fact, they are high grade in every particular and have several important features not to be found in any other hatcher.
Prices reasonable. Results guaranteed. Send for beautiful illustrated catalogue, mentioning this paper. Reliable agents wanted. Address
GEM INCUBATOR CO.,
Box A1, Dayton, Ohio, U. S. A.

200-Egg Incubator for \$12.80
The simplicity of the Stahl Incubators created a demand that forced the production to such great proportions it is now possible to offer a first-class 200-egg incubator for \$12.80. This new incubator is an enlargement of the famous
WOODEN HEN
recognized the most perfect small hatcher. This new incubator is thoroughly well made; is a marvel of simplicity, and so perfect in its working that it hatches every fertile egg. Write for anything you want to know about incubators. Send for the new free illustrated catalogue.
GEO. H. STAHL, Quincy, Ill., U. S. A.

355 Eggs
354 Chicks
That's the result Mr. Geo. McDowell, Che-mung Center, N. Y., obtained with an
IOWA ROUND INCUBATOR
The incubator that rounds out the largest number of chicks per hatch every time. If you are sure of your eggs you can rest assured of the same number of chicks—strong and healthy—with the Iowa Incubator. Catalogue and prices free on request.
Iowa Incubator Co., Box 140, Des Moines, Iowa

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

PAINTING BY MACHINERY.

THE SPRAY PAINTER.

FOR APPLYING ANY KIND OF PAINT OR WHITEWASH.

Over 30,000 of Our Painting Machines in Actual Use. More than all other styles combined.

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.
THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the Louisiana Purchase Exposition amount to something over 12,000,000 square feet, all of which is practically completed at this writing, and at least 95 per cent. of this work was done with the machines we bought from you. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

We take pleasure in stating that, in our estimation, your machine is far superior to anything on the market.

The cold-water paint used amounted to almost 400,000 pounds.

Respectfully yours, BUILDERS' CONTRACTING COMPANY.

SPECIAL OFFERS FOR EXPORT:

Hook's "Best" Pneumatic Painting Machine (twenty-five of which were used in painting the buildings of the Louisiana Purchase Exposition), equipped with 25 feet pneumatic hose, 8-foot extension rod, for reaching ceilings and overhead work, and two nozzles. Gross weight, 250 pounds. Net weight, 125 pounds. Size of box, 20½x19½x47 inches. Price, each, \$25.00.

Hook's "Best" Pneumatic Painting Machine.

Hardie's No. 7 Painting Machine comprises a patented brass pump with brass ball valves, ingenious agitator and paint mixer, contained in a 30-gallon barrel, mounted on wrought-iron wheels, 26 inches in diameter, with 1½-inch tires, and is as easy to wheel as a baby carriage. It is equipped with 10 feet of high-grade ½-inch hose, long extension rod and special disgoring painting nozzle. Will spray any liquid of a sprayable nature. Weight, 110 pounds. Packed in two cases—one 9 cubic feet, one 7 cubic feet. Price, each, \$17.50.

Hardie's No. 7 Painting Machine.

The prices above quoted (U. S. Gold) include packing and delivery at New York City.

THE "STAY-THERE" READY-MIXED COLD-WATER PAINT

is composed of minerals ground in a liquid chemical, to be thinned with water. Packed in tight, iron-hooped barrels. It is as durable as oil paint; is fireproof, weatherproof, washable and sanitary.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the Only machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

NEW YORK SALESROOM: 96 CHAMBERS STREET

DIETZ Nos. 1 and 2 COLD-BLAST LANTERN BLIZZARD.

These Lanterns are the culmination of a vast deal of experiment, and are offered as something *extra good* in the Lantern line. We call them "Cold Blast," for the reason that they are fed exclusively with cold air, that which comes from above, being taken in through openings between the two rings at the top.

This system of air-supply greatly stimulates combustion with the resultant extra volume and intense whiteness of its light. They are fitted with an entirely new and most effective device for raising and lowering the globe, which also locks the burner in position. They are, in point of fact, a close following of the well-known Dietz Globe Street Lamp, and, as already stated, will meet the demand of any one seeking an "extra good" Lantern. No. 2 is fitted with 1-inch burner and "Blizzard" globe. No. 1 is fitted with No. 1 burner and "Blizzard" globe.

Price, No. 1, \$13.50 per doz.
No. 2, 16.00 "

We are pleased to send complete catalogues (Spanish and English) and price-list of our complete line of Lamps and Lanterns to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is $2\frac{3}{4}$ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

MICHIGAN WASHING MACHINE CO., Mfrs., Muskegon, Mich., U. S. A.

Also makers of the world-known "Muskegon" and "Michigan" Washing Machines, over 250,000 of which are in use throughout the United States. NOTE.—When ordering through export houses, to prevent mistakes, please mail us a duplicate of your orders.

GUARANTEE WASHER.

ONCE SOLD, THEY NEVER COME BACK.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

VOSS BROS. MFG. CO.,
DAVENPORT, IOWA, U. S. A.

THERE IS NO FRICTION.
NO LOST MOTION.

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
5. The tub has a wringer box, fastened with steel brackets.
6. The lid on tub closes tight, no escape of steam.
7. Has gilded hoops, castings and name.

Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

"AMERICA."

WHILE Shakespeare may have been technically justified in making disparaging remarks as to the importance of a name, yet there are many in commercial circles who unhesitatingly assert that *everything* depends upon the name.

So it is that while some may be disposed to cavil at the decision of the State Department to substitute the term "America," or "American" for "United States" in official correspondence with diplomatic, consular and commercial agencies of the Government men of business will be quick to realize that the course taken by Secretary Hay is a step in the line of directness and simplicity. For more than one hundred years the United States has been known to the outside world as America and its people as Americans.

It may be objected that Canada, Mexico and Brazil are just as much entitled to call their countries "America" and their citizens "Americans." So they are; but it is a fact that they are not so styled popularly and the probability is that they would object if they were.

An argument in favor of the change is that it will tend to avert confusion. Several other countries use "United States" as part of their titles, as Brazil, Mexico, and Colombia. No one would think of referring to either as America. On the contrary, no one would be misunderstood in referring to the United States as America.

Again, the term "America" includes the whole country from the Great Lakes and Maine to the Gulf, Territories as well as States, while "United States" takes in only the States received into the Union and for that reason can be criticized as an incomplete designation.

For many years, as a matter of convenience, the official residences of the diplomatic officials abroad have been described on the official mail as "the American Embassy," or "the American Legation," according to grade. Secretary Hay now has extended the same system to the consular officers in foreign countries and henceforth they will be officially, as they long have been actually, known as American.

SYSTEM IN AMERICA.

NOT a little of the success achieved by American manufacturers and merchants, both those engaged in foreign commerce and in home trade, is due to popular education in practical methods. System of operation in every branch of the factory and business office has long been a conspicuous part of the domestic economy of Americans. It has gone so far that a magazine, called *System*, has been established and has acquired a large circulation. The magazine is devoted entirely to recording the latest and most improved methods in securing systematic work in the various fields of business

effort. That such a publication has attracted so much attention shows the anxiousness of American employers to consider new methods of conducting their office affairs and their willingness to make improvements in any details of their business, wherever the same may be found advisable or necessary.

In another direction a similar movement toward successful incentive is offered by another American publication, *Popular Mechanics*, from which we sometimes quote articles that are of moment to our readers. This magazine treats in popular language of many matters of mechanical interest with which the less advanced laymen ought to be conversant. It gives them a better idea of what is going on in the world of mechanics than they could otherwise obtain. The accounts in the technical journals they would not thoroughly understand and the daily newspapers do not cover the field adequately. *Popular Mechanics* is an educator of distinct value to the American people and that it has a large circulation is due to the increasing interest on the part of Americans generally in the progress of the country.

American technical editors are becoming more advanced than ever before. Most of them are adopting the policy of writing their articles so that they are more understandable to the layman than was formerly the case. The journals pursuing this policy are reaping the harvest of larger circulation. We would like to mention some of these journals, but so many come to the office of THE AMERICAN EXPORTER that we fear such a list as we might print would possibly omit some exponent of the new idea and create the suspicion that a slight was intended.

AMERICAN WIRELESS WINS.

A VERY important step in promoting international commerce was taken last month by the United States Government when it closed a contract with an American wireless telegraph inventor under the terms of which the world will be at least half-girdled by the comparatively new method of communication. The system chosen is curiously enough one of which little has been heard abroad. Americans will take a patriotic pride in the choice, for the inventor has been a modest man and has not sought to exploit his ideas or intentions in advance of the realization of his plans. As will be learned by reading an article on the subject, published on another page, the contract means much for commerce. In fact, the contract is a guarantee of further progress.

Marconi and other wireless inventors are known throughout the world, while our American inventor, De Forest, has scarcely been heard of at all. The Marconi invention has been exploited to the four corners of the earth, but it is left for a bright but plodding American to put into actual and active being the first great wireless system of commercial utility. His achievement does not necessarily detract from the fame or credit which may be due Marconi. It is simply an instance showing where American genius has played more to practicability than to the galleries.

ADVERTISING is the life of the American export trade. It is a noteworthy fact that the most successful manufactured articles are the most liberally advertised. The export papers reach thousands of prospective customers at less comparative expense than is involved in the employment of a high-priced salesman who may meet one prospective customer—or perhaps two—while the papers go into the offices and homes of thousands.

AUSTRALIA continues to send in large orders for American appliances of various kinds, and letters from purchasers received by our manufacturers give gratifying evidence of appreciation of the latter's efforts to supply the best goods for the lowest reasonable price.

CUBA is becoming a larger purchaser of our sugar-making machinery. American manufacturers in this line excel in the quality and reasonable prices of the goods which they offer to persons requiring such articles.

SHIPPING COMBINE'S PROGRESS.

WHILE the report of the International Mercantile Marine Company for the year 1903, issued only last month, was expected to make a poor showing, the result was by no means so adverse as had been predicted. There was left a surplus for the year of nearly \$2,000,000. Promises are made by the managers that "greater cooperation on the part of the various lines and the elimination of unnecessary expenses" will materially increase the prosperity of the company. It is worth mentioning that the trust now controls 133 vessels, with a total capacity of 992,000 tons and that additional ships of 90,000 aggregate tonnage are under construction. The company operates no fewer than thirty-three distinct regular ocean routes.

President Ismay holds out hope to the shareholders that results will be better in the future, but he bases his expectation upon the promises which we have just quoted. We do not believe that these intentions alone, if carried out, will make any material or thoroughly satisfactory improvement in the financial results accruing from the combination. The shipping trust's managers must go further and look more carefully and effectively in the direction of providing better means of transportation for the commerce of the world.

If there is one thing more than the freight traffic of the world that needs improvement, we will have to be informed regarding it. The operation of the shipping trust was in the direction of cutting down expenses and attempting by cooperation to produce the same results. This the managers have not done; nor have they gained the expected financial profits by their economies. We would not want to say that there has been any fault of the management, but it is obvious to persons conversant with our foreign trade that there has not been shown the delicate balance of good judgment in effecting economies in operation without interfering with the extension, expansion and betterment of the service. In other words, the managers have apparently tried to earn dividends by cutting down service and expenses, without making any great effort to improve and increase the facilities for the interchange of commodities between the various countries affected by the company's operations.

To be brief, economy and contraction have guided the managers. In this era of progress that is the worst sort of policy, for there is a crying demand for better shipping facilities not only in America but in other countries. Take the Mediterranean field as an example: Transit between the ports of America and the ports on the Mediterranean Sea is so conspicuously bad that trade between the two regions is carried on under disadvantages which are certainly discouraging and are almost prohibitory to any but very enterprising and persistent people. This field alone would be worth cultivation by the shipping trust. There are many others that are capable of greater yield, both for the trust's vessels and for merchants engaged in international trade. We hope the managers of the International Mercantile Marine Company will take a new survey of the situation and turn over a new leaf on which may be printed: "Progress, better service and greater profits."

FAILURES are as inevitable as are successes in such a vast country as the United States. The percentage of failures in relation to the volume of successes is steadily diminishing and, compared with the enormous volume of business transacted, the failures are hardly worth noticing. In fact, they would receive no mention at this time if it were not for the fact that one of our commercial agencies recently sought to ascertain the cause of failures and the result in one respect at least may interest our foreign readers. It was found that eight-tenths of the bankrupts were of the class who do not advertise and had no other means of letting prospective purchasers know that they had goods to sell. Publicity produces trade.

AMERICAN steel rails seem to be in higher appreciation abroad, judging by the jump in exports from 7,345 tons in May to 21,291 tons in June. This showing needs no comment.

MEXICO seems unable to obtain enough American machinery of every sort and exporters dealing with that country are happy.

FACTORY VS. THE FARM.

A FEATURE of our export trade that has been overlooked is one of unusual interest from a variety of points of view. It was not until within the current calendar year that our manufacturers have been able to eclipse our agriculturalists in the value of the products that are going from both to foreign consumers who recognize the worth of our products. In going over the statistics of trade it has only just been discovered that it was in May of this year the factories first eclipsed the farms in value of exports. The total value of manufactures exported in 1904 was \$38,894,561, against \$37,891,838, the value of agricultural products exported. Ordinarily the value of agricultural exports is more than twice as great as that of manufactures exported.

There has been but one complete fiscal year in the history of our export trade in which the total exports of manufactures were even half as great as the total exports of agricultural products. In 1900 the value of manufactures exported was \$433,851,756 and of agricultural products \$835,858,123, so that in that particular year the value of manufactures exported was a little more than one-half that of agricultural products exported, but never before has the export of manufactures equaled or exceeded the value of the agricultural products in our figures of domestic exports.

The showing is a tribute to the splendid achievements of American manufacturers of agricultural and other kinds of machinery. In the agricultural line our own farmers have long had the advantage of the use of improved implements and in this way they have been enabled not only to supply the domestic demand for the products of the soil, but they have found it possible to create an extensive export trade. Farmers in other countries some years ago began to realize that our agricultural implements were not luxuries, but real necessities, and the result has been a great increase in the demand made upon American manufacturers. The exhibit for May possibly will not be maintained, for it is phenomenal, but it serves to call attention to the rapid growth of the exports of our manufactured articles.

The best proof of the worth of a pudding is in the eating. Our friends in foreign countries who have tried American implements or machines have continued to use them, being satisfied that the goods are the best that can be sold for the price.

CANADIAN implement houses are making a strong bid for the Australian trade. A correspondent in Sydney writes as follows to THE AMERICAN EXPORTER: "Your manufacturers have a decided advantage over all competitors in the harvesting machinery trade, but the British and Canadian manufacturers are persistent in their efforts to capture the trade. I do not see how they can succeed." Which news will be thoroughly appreciated by those whom it may affect, including those of our foreign readers who need, but have not yet obtained, any of the agricultural implements which are so well made in the United States.

RECENT statistics show that the United States is making great strides in shoe exports in the Western Hemisphere. Trade with the West Indies, British included, continues to gain and now amounts to about \$25,000 a month. Nor is this increase confined to the West Indies. It includes practically all of Latin America. Shipments to the Central American States and British Honduras have made the phenomenal gain of over 100 per cent. in a year, while Mexico has taken about 30 per cent. more and South America about 25 per cent. more. There has also been an increase of about 25 per cent. to British North America.

CANADA is branching out in the construction of steel ships. The plates now used are imported into Canada, duty free, from the United States, so that this country benefits by the maritime progress of our neighbor.

SOUTH AFRICA is taking very kindly to our mining machinery, judging by the increased shipments which have been reported recently.

THREE HUNDRED MILES AN HOUR BY RAIL?

IN THE AMERICAN EXPORTER of April, 1903, we printed an extended account of the invention of Professor Albertson, who expects to obtain a speed of 300 miles an hour for railway trains run over a system of his own construction, using an elevated rail with suspended cars and depending upon magnets to lighten the load-weight, thereby permitting greater speed with the motive power used. Most of our readers have probably forgotten all about the matter, but the subject was interesting and there are some who will remember the account which we printed of the wonderful miniature magnet train. In fact, we received some inquiries about it from readers abroad. To refresh the recollection of other readers it may be said briefly that Professor Albertson expects to obtain the high speed largely through magnetism, created by electricity, on an elevated right-of-way fully protected from obstruction. The American newspapers have from time to time mentioned the Professor's intention, but there has been no action until within the last month which made it necessary for us to again refer to his invention.

There is now under construction on Staten Island, a suburb of New York City, an experimental track two miles in length, upon which Professor Albertson expects to demonstrate the merits of his invention. The work of constructing the track has created fresh interest in magnetic trains and one of the New York papers one day last month reprinted almost word for word the article on the subject which appeared in THE AMERICAN EXPORTER more than a year ago. In connection with it there were, however, interviews with electrical engineers who doubted the practicability of the principle upon which Professor Albertson bases his chief claim for success. At the time we printed the matter for the information of our readers and without any indorsement. Now the electrical experts are disposed to go further, even before the tracks are finished or the cars are put in operation. They say that in trying to run at a 300-mile an hour speed the magnets are likely to drag the train and perhaps pull the structure itself to pieces, provided they work at all upon the Albertson principle. Edison, Westinghouse and other American inventors met with equally capable, experienced and scientific doubters who pronounced their inventions impracticable. The learned critics of Professor Albertson have not, so far as we know, raised the objection that the attainment of a 300-mile speed upon a track two miles long, with allowance for initiative action and for stopping, is something entirely out of the question. On a two-mile stretch of track it is doubtful if a higher speed than fifty miles an hour could be attained at the point where diminution of speed would have to be begun. It is regrettable that Professor Albertson has not found the ways and means for building a structure at least ten miles long. At 300 miles an hour it would take only two minutes to travel the ten miles, and it is doubtful if, allowing for gathering headway at the start and slowing down at the conclusion of the trip, there could be a test of the maximum speed claimed. The two-mile test might be satisfactory so far as it would go, but it would leave unanswered some of the chief objections raised by experts. The result of the experiment will be printed in our columns.

IN our last issue we printed an account of the plans of an American inventor who seeks to combine airships with elevated railroads. His idea is to equip suspended cars with aeroplanes and he expects to acquire a speed of 240 miles an hour. His use of the aeroplane corresponds to Professor Albertson's use of magnets and is intended to lighten the load. Objections that would apply to one would not apply to the other and vice versa. In printing what is claimed for this "four-mile-a-minute" invention we simply pursued our usual policy of giving information to our readers. We believe that the aeroplane idea is impracticable, but it seemed to be nevertheless interesting and it may result in something commercially useful.

RAILROAD managers everywhere are interested in increasing the speed of trains. In America the great railroad systems are resorting to electricity. For heavy trains going long distances electricity is at present impossible; the wires to carry the high power current have not yet been made. As we have fully described in previous issues, one of the greatest railroad systems in America has

adopted electric engines for its New York terminal, but it has not been able to go further because the wires will not carry the necessary power. There is a fortune for some bright American who will provide the means for supplying fast trains on the big trunk lines with continuous electric power. It will come soon, for there are many minds at work upon the idea.

On the trunk-line railroads a speed of at least sixty miles an hour must be available. To supply the required power by electricity is a problem that is being worked out. On short railroads in the United States it has been solved. As to the progress that may be made in applying the subtle current to the long-distance trains we may not have to wait very long. This, of course, applies to the substitution of electricity for steam upon surface railroads. Electric motors on an overhead right-of-way anywhere would develop great speed; in fact, on the New York elevated railroads a speed of thirty miles an hour is found feasible with stops at stations less than a quarter of a mile apart. On longer stretches of similarly protected roads the only limit of speed is the capacity of the motive power.

It must be realized that the distance covered by a 30-mile-an-hour train depends upon the frequency of stops at stations. On the New York elevated, if a 15-mile-an-hour train went straight through it would get to its final station quite as soon, but with the express trains the electric motors have cut down the time very much.

This dissertation on the comparatively slow speed of the New York City elevated trains may not seem to be germane to the question under discussion, but it is at present the most successful practical elevated railroad structure in the world and its trains have gained wonderfully in speed since steam engines were replaced by electric motors.

UNDER-SEA TRAINS.

IT is not surprising to learn that the French Chamber of Commerce has indorsed the plan for a tunnel under the English channel, but it is a matter for wonderment that the plan meets with so little favor in Great Britain. It is unlikely that the two countries will ever become imbroiled in hostilities, and if that unfortunate condition should happen, a pound or two of dynamite would seal the tunnel. A contemporary compares a channel tunnel to the Panama Canal. Frenchmen originated that great public undertaking and they seem to think that a tunnel practically between Paris and London is not much more of an improbability. Opposition to it cannot come from progressive men. The tunnel is inevitable. It is only a question of time when the tunnel will be built and it will be an important factor in preserving friendly relations between the two nations on the opposite shores of the choppy sea that separates them.

While the Frenchmen may be expected to push along the preliminaries, just as they did in the Panama Canal matter, it will not surprise us if British capital and enterprise should make this great twentieth century scheme a reality, much in the same way that American capital and enterprise have gone to the forefront in commercial progress to make De Lesseps' dream an actual factor in the economies of the world.

The French idea is to use the tunnel for an under-sea railway, with forty-eight trains a day, twenty-four to start from each side at hourly intervals. Such a plan would not be practicable, but the railroad managers would quickly adjust the train schedules with proper regard to the convenience of the patrons. The off-hours could no doubt be used to advantage for freight traffic. But why should we speculate about the operation of a railroad that may not be built for several years to come?

IT is unfortunate that a rip in Santos-Dumont's air bag should put off the solution of aerial navigation indefinitely. The American World's Fair would have formed a picturesque background to the French inventor's triumph—if the airship had not been wrecked before time came for the test.

REPORTS from England are to the effect that the American Westinghouse interests have secured some new large contracts for the electric equipment of municipal railroads. The moral is obvious.

FUTURE OF SUBMERSIBLE BOATS.

THAT we are on the eve of a revolution in naval construction and that in the near future we shall look with accustomed eyes upon submarine, or, rather, submersible vessels of thousands of tons may, perhaps, be considered by many a visionary idea. Their views, however, are not shared by Mr. Allan H. Burgoyne who read recently before the Royal United Service Institution of Great Britain, a paper on "The Future of the Submarine Boat," in which he thus sketched his idea of the subject:

"It will be of large tonnage, the displacement being governed by the extent of the armament and internal fittings; of good speed, at least twenty-five knots on the surface; well armed, by which I imply from four to six torpedo tubes and an equal number of small, quick-firers; well protected by an armored deck, and, lastly, well provided for in the matter of safety appliances, for it would be deplorable if the officers and men who devote their lives to submarine navigation should not be given the same chances in the event of an accident as their fellows of the upper sea; and it is due to the nation that the future policy of our Admiralty in this respect should be made public."

Mr. Burgoyne concludes that Americans have made great advances in this line of naval construction and speaks in terms of high praise of our "Holland" submarine boat. "It would," he says, "be foolish to say that the ideal shape had already been discovered, but the 'Holland' is very nearly all that can be desired."

An interesting comparison is made between the "Holland" and the French *Goubet*; a vessel capable of withstanding the pressure at a depth of about 5,000 feet or very nearly a mile below the surface. The "Holland" is able to navigate safely at 150 feet. The difference seems astounding. Even if we allow the "Holland" a margin of safety equal to 850 feet, the *Goubet* is yet capable of withstanding five times as much external pressure as the "Holland." Mr. Burgoyne points out, however, that the value of this immense strength of the French boat is not apparent and that there is little doubt that any advantage it may confer is negated by the lack of stability inseparable from its form of construction.

"In the 'Holland,'" says Mr. Burgoyne, "we have, perhaps, the nearest approach to nature's submarine—the fish—that it is possible to obtain. The heavy forward part and the fine diminishing tail are the great features of all the 'Holland' craft. This form is so stable that oscillation is entirely absent when submerged especially in the first 'Holland' designs, which are short and stumpy. For although the weight is unevenly distributed, the equilibrium is perfect, owing to the fact that in the bows, which support the major portion of the weight, the buoyance is greater, and can thus sustain it, whilst towards the stern the gradually diminishing surface of the hull reduces the buoyant power and thus equalizes the pressure evenly over the whole length of the vessel."

Concerning his desire to see submersibles of much larger dimensions the lecturer thus explained his views:

"To carry all these things—armor, guns, larger engines for increased speed, more room for fuel, extra torpedo tubes, safety appliances, etc.—a greater displacement is essential. Our latest vessels, *A2*, *A3*, *A4*, have been given a second torpedo tube and a higher speed by six knots than their forerunners, but to obtain this the displacement had to be nearly doubled. Yet even their 200 tons is not sufficient—France is already approaching the 500—and I hope soon to hear of submersibles of six to eight hundred tons (submerged displacement) being ordered. These would be approximately the size of our destroyers, for, be it remembered, if one of them were submerged to the deck, at least 250 tons would be added to the weight of water displaced."

Mr. Burgoyne's idea of the perfect submarine boat is thus expressed:

"It would be a vessel of special type, the shape to be determined by experiment, but with no speciality of form essential, capable of navigating not only on the surface, as an ordinary ship, but also beneath the surface of the sea, and continuing its course in a direct line for the object it is desired to reach, whilst retaining stability in every sense, and being under the complete control of its commander; and besides conforming with these conditions it must

possess the maximum of speed, safety, offensive power and habitability, a trustworthy means of propulsion, and a complete independence of all exterior help while in action."

In the course of his introductory remarks Mr. Burgoyne gave a very interesting résumé of the evolution of the submersible. It is, as he said, hard to believe that whereas in 1890 the French possessed only the *Gymnote*, of thirty tons, now, fourteen years later, they have six submersibles of no less than 422 tons on the stocks. He does not believe with all his enthusiasm that the submersible will ever entirely supersede the surface warship, nor does any other person.

FARMERS AND IMPLEMENTS NEEDED.

ARGENTINA'S future from a commercial standpoint is brought forward, in a manner to command attention, by a United States Government report giving the results of an investigation of the agricultural resources and conditions in our Southern neighbor's territory. It has been a matter of common knowledge that the grain-growing possibilities of the Argentine Republic were immense, but the report indicates that outsiders have really underestimated the situation. The region is well adapted for the growing of grain and the present area devoted to wheat alone is about 10,000,000 acres, but an eminent Argentine authority is quoted as saying that more than 80,000,000 acres in the Republic could be devoted to successful wheat farming, if there were the necessary farmers to do it, while there were other vast areas capable of agricultural development.

The trouble with Argentina seems to be that although it is in the temperate zone it does not attract the right sort of settlers. People living in the northern temperate zones do not seem to care to cross the equator to reach the same kind of a climate in South America. The immigrants arriving are not good farmers and that is what Argentina wants. If the southern republic had the farmers her granaries would prove an important factor in the problem of feeding the world. Her known available acreage is twice that of the United States. In other respects the growth of agricultural exertion in Argentina will be watched with interest in the United States, for this country may be expected to gain increased trade in farming implements as our sister republic extends the area of cultivation of her soil.

OUR fruit exports for the fiscal year 1904 will exceed \$20,000,000, according to Government returns. The growth of this branch of our export trade will be fully realized when it is taken into consideration that of this large sum \$17,000,000 has been added in the last decade. In the previous ten years the growth amounted to only \$1,000,000. People of other countries seem to like our natural products as well as they do our manufactured goods.

ARBITRATION between great nations scored another victory last month when Germany and Great Britain put into force a treaty providing for the settlement by arbitration of differences of a legal nature that may arise in the interpretation of existing treaties between the two countries. The terms are similar, we understand, to those of treaties recently concluded with France, Italy and Spain.

WAR news from the Far East is far from satisfactory. There are no immediate indications of a restoration of peace, and the accounts received of the progress of hostilities are conflicting. One day we learn that 30,000 Japanese have been slaughtered and the next day the number is reduced to 2,800. So it goes with information about the Russians.

GREAT BRITAIN is not disposed to stand for any trifling with her commerce on account of the difficulty between Russia and Japan and the consequence was a fresh scare phase of the Far East war.

IF Russia and Japan could only be induced to stop fighting and arbitrate, what a glorious thing it would be for modern progress!

AMERICAN WIRELESS WINS.

United States Government a Partner in New System That Half-Circles the Earth.

A CONTRACT executed last month between the Government and the American De Forest Wireless Telegraph Company for service in the West Indies and at Panama marks a long step forward in the history of this marvelous method of communication and makes it possible to send a wireless message from a ship at sea off the American coast, near New York, through a chain of stations extending to Japan, China or the Philippines.

The contract is especially notable as the largest of its kind ever executed, and the guarantee of the company to maintain at all times and under all atmospheric conditions communication between stations 1,000 miles apart, gives assurance that obstacles to the successful application of this invention or discovery to the commercial needs of the world have at last been surmounted.

The new circuits will be from Key West to Panama, Porto Rico to Key West, south Cuban coast to Panama, Pensacola, to Key West and south Cuba to Porto Rico, distances of from 450 to 1,000 miles. Between the points large bodies of land intervene and the currents cross and recross each other, so that under such conditions the successful maintenance of communications between stations should demonstrate the ability of the De Forest instruments to operate under any and all conditions.

Like the wire telegraph the wireless owes much to the Government, which was quick to realize the benefits to be derived from its success. The Wei-hai-wei station of the De Forest company, which has been in successful operation for six months, has been repeatedly utilized in the transmission of intelligence of the progress of the war in the Far East when other means of communication have been entirely without avail. The equipment of the Japanese ships for wireless telegraphy enabled them to keep in close communication with each other and with their home ports. The information thus conveyed has been directly responsible for some of the most telling blows struck by Admiral Togo.

It is a source of pardonable patriotic pride that this remarkable instrument is the product of the inventive genius of Lee De Forest, Ph.D., Yale, a young American who has been responsible for much wonderful progress made in wireless work within the past ten years. In the war maneuvers of 1902 and again in 1903 the Government experts reported that this was the only system that operated under all the difficulties attending on the work, and the service during the recent tests conclusively demonstrated the ability of those utilizing it to transmit messages without interference because of the location of similar stations in the same magnetic zone and with the possibility of their interception by other systems totally eliminated.

By the terms of the Government agreement with the De Forest company commercial messages are exchangeable between all stations and ships equipped with the De Forest instruments, whether maintained by the Government or by the company. For this purpose all the war vessels of the American navy will be equipped with the De Forest attuned apparatus, and all messages will be transmitted between war vessels and passenger steamers and between land stations, irrespective of whether they are under the control of the Government or the company.

The chain of communication thus established is practically one system operated in part by the Government and partly by the De Forest company. It is understood that having thus adopted the De Forest system and entered into such a combination with the company controlling it the Government is guaranteed against the employment of the system in any manner which might prove detrimental to its interests, and it is reported that its exclusive use for war vessels has been guaranteed to the United States navy.

The vast possibilities opened by this arrangement can be better realized when it is stated that the chain of stations operated by the De Forest company and the Government will extend from the American New England coast, at Boston and Providence, through New Haven, New York, Lewes, Del.; Norfolk, Cape Hatteras, Pensacola, Key West, Guantanamo, Porto Rico, Panama, Lower California, San Francisco, Portland, Seattle and Cape Flattery, thence to the Orient by way of Dutch Harbor, the most southerly point in the Aleutian Islands, to Kamschatka, Japan, and the Philippines, with Wei-hai-wei, in China, returning by a southerly route to Guam, Hawaii and San Francisco.

Thus the chain runs half round the world, touching no territory not under the American flag except Wei-hai-wei, where the station has been in operation for months, and in Japan, where the concession has been obtained and where the service will be operated in conjunction with that of the Japanese Government. The establishment of a station at Washington, on the Pacific Ocean coast, which will take place before long, although the fact is not generally known, will enable messages to be exchanged by wireless telegraphy between the seats of Government of the United States and Japan by an American system operated entirely on American territory, except the one station in Japan.

At Panama the highest mast in the world for wireless telegraphy is being erected, while at Cape Flattery, Washington, the largest station in the world is being built. The one at Dutch Harbor, among the largest, is in operation, being the key of the Alaskan business.

Life of American Machinery.—Although the rapid improvements in electrical devices make apparatus apparently out of date in a very short time, a good deal of early American electrical machinery is still in use and giving a good

account of itself after prolonged years of operation. Some of the early Edison dynamos are still doing good work. On the other hand, a great deal of old machinery has been worked over. The managers of a steel plant at Hamilton, Ontario, say that they have worked over into steel the iron of the original Niagara suspension bridge, that of the Victoria bridge at Montreal, the hull of the once-famous Atlantic steamship City of Rome and the framework of the Great Eastern.

Telephoning Over a Ray of Light.

CONSIDERABLE progress is making in the development of wireless telephony. An exhaustive series of experiments which have been carried on during the past few years at the headquarters of the American Telephone and Telegraph Company, in Boston, under the direction of Mr. Hammond V. Hayes, have produced results which are now being shown for the first time to the public at the St. Louis Exposition and which receive some attention in a recent issue of the *American Inventor*.

Mr. Hayes' apparatus, known as the radiophone, admits of effective telephoning over a ray of light for considerable distances. Words spoken at the company's offices in Boston have been distinctly heard through a telephone receiver at Fort Independence, two miles down the harbor. The appliances in detail are very simple. A searchlight of the ordinary type is manipulated from a window, the glass being removed from the front of the lamp to let in two telephone wires which are attached to the wires that constitute the arc circuit. By the superposition of one circuit upon another and by use of a telephone transmitter it is easily effected. On speaking into the instrument a series of fluctuations is started, causing variations in the quantity of illumination developed by the lamp and therefore in the intensity of the beam thrown off by it. Of course, the variations in the stream of light cannot be detected by the naked eye, but they exist, and when the light streak has been photographed their influence is easily discerned.

The searchlight is thrown upon a receiving station at a reasonable distance where a parabolic mirror gathers in the light rays as they arrive, focusing them upon a tiny glass bulb containing a little bar of selenium. This metal, wound around and around with thread-like wires, is in a telephonic circuit, and, by virtue of its well-known characteristics, it varies in conductivity according to the intensity of the illumination to which it is subjected. With any alterations in the power of illumination the quality of the current transmitted varies correspondingly. The little bit of selenium, in other words, responds to every minute change in the light intensity of the dazzling beam and causes the current of the circuit to convey to a telephone receiver a reproduction of whatever is said at the other end of the light beam.

One of the fields of usefulness that has been suggested for the radiophone is in wireless telephony at sea. In order that conversations may be carried on over considerable distances it is only necessary that each ship shall have its own searchlight and receiving apparatus. Objection has been raised that it will be extremely difficult to keep the searchlight trained upon the bit of selenium, especially in rough weather. It is certain, however, that marksmanship may be developed with the searchlight as well as with the rifle.

Another suggestion which has been made is that music may be transmitted by use of the radiophone. If, for example, a military band should play a march in an electric-light station anybody in the vicinity could listen to the music, provided he had access to an incandescent lamp connected with the system. It would be merely a matter of bringing a telephone transmitter into connection with the generating machinery at the lighting station in substantially the same manner in which it is connected with the searchlight. When given such connection every note played by the band would cause a fluctuation in the electric current that could be felt in every arc and incandescent lamp in the circuit. All one would have to do would be to establish a selenium cell near one of the lights, attach a telephone instrument and listen to the music. The mysterious metal responds to the changes in the current in so wonderful a fashion and with such sensitiveness that every sound is conveyed faithfully, regardless of the intervals between sounds. During recent experiments in Boston calls played upon a bugle near an arc light were heard distinctly over the rays at a distance of several hundred feet.

A German View of Our Foreign Trade.

A GERMAN trade paper, *Export*, recently printed a series of articles devoted "to studying the methods by which American goods are supplanting German goods in foreign markets." The articles consisted largely of letters from Germans living in Mexico, Venezuela, Brazil and Australia. The writers explain that the German houses are being beaten because they are unwilling to guarantee agents fixed salaries, as the Americans do, and also because they depend on sending out catalogues, whereas the Americans keep stocks of goods in established agencies, where buyers are able to purchase after seeing the goods, and therefore prefer to deal with Americans. The German agents, it is added, are largely taking service with American houses, because of the better terms offered them and owing to their handling exclusively American wares. *Export* urges the German manufacturers to abandon their "penny wise, pound foolish policy" and give their agents decent fixed salaries, so as to enable them to withstand the "flattering offers of their American competitors," adding: "This is all the more important since American competition in the world's markets will evidently grow keener during the next ten years."

British Comment on America as a World Power.

OUR esteemed contemporary, the London *Spectator*, recently printed an editorial on the subject of America being a "World Power," from which the following extracts are taken:

"To deny to America the right to enforce compensation for injuries caused by Turkish misrule is, therefore, to exclude her from the benefit of the general rules applied to all other great civilized states, and, in fact, to deny her right to be included in that honorable list. Upon what principle is such a denial to be based? America is as populous, as powerful and as civilized a state as there is in the world, and her geographical position has nothing whatever to do with the matter. Or, rather, it has this to do with it, that as she does not want, and could not want, territory in Europe, she is much more likely to be disinterested and impartial than any other power. With any of the European powers, humanity, or an individual quarrel, might be a pretext for aggression; but America cannot even wish to aggress, and may be trusted, if she demands any change, to desire that change because of the motive assigned.

"It is said, indeed, in some quarters that America being so distant a power can have no good reason for interference; but that, surely, is matter for her own decision, not the decision of Europe. She has as much right to her own ambitions, her own purposes and her own complaints as any other power, the fact that her ambitions cannot be territorial being in her favor, not against her. It is true that, being comparatively a new power, she is not aided or hampered by volumes of old treaties, to be quoted or disregarded as occasion serves, but that fact renders her more free, not less free, to act upon general and civilized principles.

"There is in reality no case against American 'interference' except the reluctance of diplomatists trained to consider Europe as their world to admit that a new state has arrived at such a position in population, wealth and all attributes of civilization that it must be consulted when it wishes to be, and has as much right to plead the general interests of mankind as any other state. That she will be consulted is pretty clear, for, after all, diplomatists, like all other politicians, have to deal with facts. No state is now so strong that, unless compelled, it will declare war on the Union, and a combination of states against her is barred by the refusal of Great Britain to allow any such attempt. Seated on two oceans, with unlimited wealth, and a population possibly more patriotic than that of any other white state, her weight must be felt in every corner of the world. The trend of events, too, is in her favor. For the next half-century the struggle of civilized mankind will be for dominance on the Pacific, and while the Union is already strong in that vast ocean, from the moment the Panama Canal is cut she will be the strongest state upon its shores. Alone, or in alliance with Japan, she could debar Europe from the trade of the future or from expansion in the Far East.

"To talk, therefore, if any one has talked, of her being an intruder in European politics is positively foolish, the only wise course for the diplomatists being to admit her at once, before they must, to all European councils, and to treat her in all matters, whether of importance or only of ceremonial, as an honored member of the great European family which claims the primacy of the world, and certainly disposes of the greater portion of its strength and wealth. America is no longer an outsider, and the attempt to treat her as one does but turn valuable friendship into bitterness."

Electricity in Japanese Warfare.

ELECTRICITY'S use in war is becoming more and more useful. The American periodical, *Electricity*, in commenting upon the subject, says:

"The world is naturally astounded at the remarkable success of the Japanese in the war with Russia. To all the European powers Japan was merely a name for an island race of artistic tastes, gentle manners and a semi-barbaric civilization. But the revelations that have come to their startled eyes show underneath the artistic tendencies, peaceable demeanor and Oriental splendor the practicability, aggressiveness and thorough knowledge of modern science that places Japan on a par with the so-called mightier powers, whose vaunted civilization and progressiveness have been accepted as representing the fruit of generations of academic learning.

"It is said that thirty years ago the Japanese were no better advanced than the Chinese. If that is the case to what can we attribute this remarkable transformation? Is there in the Japanese spirit the same love of science that is known as one of the greatest characteristics of the German people? Is Japan discovering within herself latent powers which have recently exhibited themselves as adaptability in the handling of modern machinery and inventiveness in the field of electricity and high explosives?

"The Japanese have shown thorough familiarity with the use of electricity in naval and military warfare. It has been stated on good authority that their wireless telegraphic apparatus is an improvement on existing types, and their electrical engineers are men of thorough training and remarkable skill, ready for any emergency that may arise in mortal combat.

"The great battleships and armored cruisers are in a sense electrically controlled, and the torpedo boats are among the first in the complexity of their electrical equipments. Perhaps it may be said that naval warfare particularly is becoming, in the light of hosts of modern electrical improvements, electrical warfare, and for that reason alone the destiny of Japan is not only in the hands of her admirals and generals, but her electrical engineers."

British Shops Adopt American Innovations.

AMERICAN shop methods are being adopted in Great Britain, to a great extent, and in most cases are meeting with favor on the part of employer and employed. It has been heretofore the custom for workmen to make a very early start and to quit work at 8 o'clock for breakfast. What is called the "one-break" system has been extensively adopted and welcomed. These innovations have been made the subject of a report by Rufus Fleming, United States Consul at Edinburgh, and, under the heading, "Americanizing Scotland's Industries," he says:

"The one-break system was first introduced into Great Britain by a Leeds firm in April, 1901, and was quickly imitated by another firm in the same town. The workmen at first raised an objection, on the ground that the day was too long to work with only one break, and asked either for a reduction of hours or a withdrawal of the system. The matter was consequently discussed at a central conference of the Engineering Employers' Federation, where it was stated that eighty-three firms throughout the country, of which twenty-six were federated firms, had adopted the system, and were on an average working a fifty-one-hour week.

"The experience of these firms, it was stated, was that the workmen, after they became accustomed to them, preferred the altered hours. It is contended that this is a much better method both for men and masters. The men do not start hungry, and, being, therefore, fresher and better rested, they are able to pay more attention, and, consequently, turn out more and better work. Then, again, the waste, inconvenience and delay caused by stopping, restarting at breakfast time, as well as the annoyance of men coming in late and the other evils of the two-break system are done away with, the output is increased and the men are healthier and more physically fit to undertake the duties of the day."

A brewery employing a large number of boys recently adopted the custom of serving coffee and rolls on the premises. They also established a standard day's work, after the performance of which the lads were allowed to depart. The result of this was that the output was increased, and at the same time the boys had more time for recreation. Both of these steps were radical innovations. The introduction of other similar workshop features which have long prevailed in this country are also noted in the report.

Britain's Pacific Provinces Drift Toward United States.

THE evolution of the North American Continent proceeds slowly, so far as its political aspects are concerned, so that while we do not indorse all that is contained in the following letter from an esteemed correspondent in Montreal, Canada, we think it is of sufficient interest to use for the information of our readers in other parts of the British domain: "The relations between British Columbia and eastern Canada are said to be by no means of a close or friendly nature, and it is beginning to be feared that they will in the course of time become even more strained. The business interests of the country on the western slope of the Rocky Mountains, in America, are becoming year by year more interwoven with those of the United States to the South, and along the Pacific coast the population is more American than British. The practically unrestricted influx of Japanese, owing to the pressure of the British Government on the Ottawa authorities, irritates the mining and fishing population, who do not consider the increase of the tax on the Chinese to \$500 compensation for the toleration of the others. The result is a dangerous cleavage in sentiment and interests between the Canadian Pacific province and the east, with a corresponding attraction toward the country to the south of it. Close observers of the situation in British Columbia have come to the conclusion that it is only a question of time when the province will seek admission to the United States. How to avert it is a problem which Canadian public men have to consider very carefully, but it is admitted that if the ties of business relations continue to be strengthened and the population on each side of the artificial boundary to intermingle as it is doing in its social intercourse, a distinct separation from the rest of Canada becomes inevitable."

Rails for Japan Are Contraband of War.

AN American steamship, the *Ormley*, sailed last month from New York with a cargo of 7,000 tons of railroad material for Japan. She cleared for Fusani and other ports of the Far East. Under present conditions the ship's cargo is contraband of war. So would be flour, oil, rice, corn or anything else that can be taken to Japan. There is no secrecy about these shipments to Japan or intermediate ports, and the underwriters have raised the ante on war risks. The possibility of Russian vessels appearing off the entrances of the Suez Canal, entailing capture and possible confiscation, has led to more than one steamship deserting the regular courses and "cutting across lots," so to speak, in order to reach their destination safely.

There is nothing wrong from any standpoint in these sailings. The Japs, or Russians, as the case may be, purchase here food or supplies that are declared contraband of war, as affording "comfort to the enemy." The ship owner, the shipper and the underwriter are all aware of the risk of capture and estimate accordingly. It is simply a case of buying and selling in the market; certain risks have to be encountered and are estimated accordingly. Those interested take their chances of capture as a speculation, and that is all there is to it.

PHONOGRAPHIC PANTHEON.

National Phonetic Archives Established in America and Collections Started by Great Universities.

TO a majority of the public the phonograph has come to be considered rather as a toy than as an instrument of serious scientific possibilities. This illusion should, however, be dispelled by the importance attached to its work by eminent psychologists. Phonetic archives have been established recently in the National Museum, in the Congressional Library, and at Harvard University, the idea being to preserve the voices of the great men of the present generation for posterity by means of phonographic reproduction. The authorities at Yale University also are contemplating a similar collection.

These phonetic archives, it is intended, shall include records from such persons as will presumably have permanent historical interest for America. An advisory committee of eminent Americans has prepared a list of ten living Americans of the first historical importance whose voices will be preserved.

The practical difficulties of preparing and preserving these autograms have now been overcome. A comparison between the cost of producing these autograms and the printing of books will show the former to be much the cheaper of the two. It is besides possible to renew these records from time to time without their losing their lifelikeness. In this way the actual tones of a voice may be heard forever. The autograms are less affected by the ravages of time than books.

The three phonetic archives recently established have commenced their collections with several excellent reproductions of the voice of the Emperor of Germany. The cylinders were prepared under the direction of Dr. Edward W. Scripture, the psychologist of Yale University. Two cylinders were prepared with the Emperor's assistance. One of these, intended especially for Harvard, contains the Emperor's observations on Frederick the Great; the second is a short disquisition on "Fortitude in Pain."

A complete collection of voice records on the lines indicated would be as comprehensive as any collection of books, since every phase of human endeavor could be represented and done full justice to. The founding of such a pantheon is believed by many to be anticipated in the scientific phonographic work recently commenced at Yale University. These investigations, which are entirely novel in their way, are to be conducted by members of the faculty. The work is made possible by an endowment by Andrew Carnegie. The plan comprises the collection of distinctive dialects throughout the country and their preservation in permanent form at New Haven.

A national phonetic survey is being made under these auspices. A feature of the collection is to be the dialects of the North American Indians, especially of the tribes which are rapidly disappearing. These records will afterward be preserved at Herrick Hall, the Yale psychological laboratory.

A serious undertaking of this nature under the auspices of a great university, of course, establishes the practical scientific value of the phonograph. That the work should be carried on as the result of an endowment is also suggestive of the possibilities of future development along similar lines.

The appeal to our sensibilities of these autograms is, of course, far more intimate than that of even the greatest books. To appreciate the value of these records to the future it is only necessary to imagine our own attitude toward a similar record of the past. The autograms of famous men, especially of their speeches or sayings upon famous occasions, even of the last few years, could they have been preserved in this way, would have been among the most valued relics of our generation.

Could the last speech of McKinley and the famous oration of Lincoln at Gettysburg have been preserved in this way they would be eagerly listened to at the present day, reverently, and handed down to posterity. And such a record of Washington's farewell address or of the original reading of the Declaration of Independence would doubtless be more carefully preserved than any single book which the country has produced.

The phonetic survey spoken of above indicates the possibilities of the phonograph along one line of scientific investigation. The study of languages also would be greatly assisted. There would be no dead languages in the future. Indeed the advantages of such records seem to be practically limitless.

Largest Magnet Has Important Uses.

INJURIES from particles of steel being violently cast into the eye, cutting their way through the various humors and making impossible their removal by methods formerly employed, have become very frequent since the employment of what is called the new steel, with the consequent increase in the speed with which metals are turned in lathes. Electro-magnets of large dimensions have been so constructed lately that the oculist can use the magnetic attraction to draw the minute particles of metal that are buried in the humors of the eye to the surface just under the cornea, and by cutting an aperture through it remove the metal. But if the foreign body has gone too far in the magnets at the various ophthalmic hospitals fail to have power enough to bring within the reach of the oculist the metal particle, and consequently the patient loses his sight.

About the middle of last winter Dr. F. M. Wilson, of Bridgeport, Conn., suggested for such purposes an electro-magnet that was altogether beyond the facilities of the philosophical instrument-maker and partook more of an

engineering problem. It required an iron core of several hundred-weight and about a mile and a half of large copper wire, and was to be somewhat over four feet high, with coils of wire as large as a water-pail.

Work was commenced on this instrument early last January in a Bridgeport factory, and recently this magnet, the largest in the world, specially constructed for the use of an oculist, was placed in the X-ray room of the Bridgeport Hospital. The powerful electric current required to energize this magnet necessitated the placing of a special wire circuit from the electric generator.

The instrument is a beautiful piece of scientific work and has some minor devices that make it unique. From its great weight it was undesirable to make it movable, as previous electro-magnets are, and so it is placed in a vertical position, and the patient, standing near, rests his face on a brass support, his eye just clearing the point of the magnet. This point can be removed so that it can be sterilized.

When the electric current is turned on this great magnet attracts pieces of iron so strongly that a strong man cannot remove them, and there are many curious experiments that can be performed with this great magnet, but it is its usefulness to the oculist in saving unfortunate artisans from blindness that gives it its highest value. In diagnosing a case of injury to the eye its negative information is often a valuable property. Frequently a workman attributes to an imaginary particle of steel in his eye the pain arising from some accidental blow. The magnet speedily demonstrates the absence of an interior irritant and proper treatment in a few days removes the inflammation which has been caused by an external hurt.

Again, a man who complains of pain, although he believes its cause has been removed, is placed before the magnet and the current is turned on. In an instant, with a cry of pain, he clasps his face with his hands and jumps away. A particle of steel which he did not believe could be in his eye has been moved by the attraction of the magnet, causing the agony.

The treatment is now far different from the former case. The steel is drawn from the surface of the eye and by a slight operation is removed and the sight saved. It is this differential diagnosis which to the oculist is one of the most valuable properties of this powerful electro-magnet.

Facts Regarding the World's Railroads.

RAILROAD mileage of the entire world, as shown in the annual statistics of the *Archiv für Eisenbahnwesen*, giving the figures for the end of the year 1902, show the mileage of railroad at that time in each grand division, was as follows: Europe, 183,997; Asia, 44,358; Africa, 14,554; North America, 233,186; South America, 28,822; Australia, 16,038; total, 520,955.

The additions to the railroads of the world for seven successive years have been, in miles:

1896.	1897.	1898.	1899.	1900.	1901.	1902.
9,796	10,747	10,864	13,533	10,800	16,551	13,338

This gives a total of 85,629 miles for the seven years, being an average of 12,233 miles per year. Of the 520,955 miles of railroad in the world, 270,881 miles are in the United States and in Great Britain and its colonies. The South American countries (including the West Indies) added but 234 miles to their lines in 1902 and but 1,804 miles in the four years then ending. Brazil is credited with no addition since 1899, and Argentina with none in 1902 and but 406 miles since 1899.

According to the authority quoted, investments in the railroads of the world amounted at the end of 1902 to \$34,964,342,000, of which more than \$18,800,000,000 have been spent on the 184,000 miles in Europe and \$16,160,000,000 on the 337,000 miles in the rest of the world. The country with the highest capital cost per mile is Great Britain (\$256,839); the nearest approach to it is Belgium (\$150,239). The cheapest in Europe are the Finnish State railroads (\$32,104), but the private railroads of Sweden are put down at \$22,558 per mile. Elsewhere the colony of West Australia has spent but \$27,597 per mile for its lines (light, narrow-gauge railroads).

Novel Use for Telephones.—The telephone was put to a novel and unusual use in Washington County, Pa., U. S. A., recently, enabling two boys, sons of farmers, to hold their positions in their classes in the public school, from which they will graduate in another year. Smallpox broke out in the neighborhood in question, and the two scholars were among the early victims. The home was quarantined, and there was every indication that the instruction which they had been receiving would be cut off for an indefinite period. But the teacher was resourceful and willing. He called up the stricken home one evening and proposed that the boys study their lessons as usual, and he would hear them over the telephone. The idea was eagerly received. Each evening they took down the receiver, and the teacher, located several farms away, heard them recite. Neither suffered through their absence from school, and their chances for graduation are just as bright as before the disease entered their home.

American Lawn-Mowers.—"In lawn-mowers those from the United States are largely preferred in Australia, being better adapted to local wants. Most of our British lawn-mowers act all right on level lawns, but are not much good when the ground is uneven. The Australian market, like most others, is mainly to be won by sending out the right sort of goods and getting known as being thoroughly reliable."—*London Correspondence Farm Implement News.*

Moving Pictures in St. Louis Machinery Hall.

IT is an interesting fact to those who have not followed carefully the growth of the electrical engineering in the past decade, that all but a small fraction of the space occupied by the biggest individual exhibitor at the American World's Fair is devoted to an operative display of electric generating units and auxiliary electrical apparatus. It will appear still more worthy of comment that the space of this exhibitor in the Palace of Machinery is enclosed within walls of a pure classic architecture, and that in one section is a beautiful little theater which seats comfortably 350 persons. The unattractive Machinery Hall of expositions of former years, a tangle of engines, belts, and exhibits framed only for the technical visitor, has given way at St. Louis to Machinery Hall, which ranks in popularity with the other big exhibition palaces at the Fair, and offers to visitors, in the display of biograph and mutoscope pictures in the Westinghouse auditorium, the biggest free show on the grounds.

The Westinghouse pictures, which were shown last month for the first time, and are now displayed at regular intervals every morning and afternoon, are distinct novelties in a double sense. They are the first interior biograph pictures ever taken—if exception be made of the two or three instances in which biograph pictures of prize fights in enclosed arenas have been obtained by the arrangement of an immense number of arc lamps directly over the heads of the fighters, 400 lamps being used at one affair. Furthermore, as they practically take the sightseer on a tour of inspection through the vast electric manufacturing works in the Pittsburg (U. S. A.) district, they may be regarded as a new style of exhibit—a display which supplements the regular exhibits at the Fair by a complete reproduction of the work-a-day scenes involved in the manufacture of the machinery exhibited.

The process by which these pictures are taken is of interest to all photographers and to all persons who have waited to see the biograph picture take its place as an important feature of industrial promotion and education. The pictures themselves appeal to the most frivolous. There are forge pictures, in which sparks fly, hammers hum and furnace fires flare. There are foundry scenes in which the spectator sees the pouring of molten metal from 25-ton kettles, and pictures in which enormous steel billets are taken heated white from the furnace and hammered into shape by steam hammer blows which seem almost to shake the auditorium in which the pictures are displayed. There are panoramic views of great American machine shops, in which the camera was carried down the aisle suspended from great traveling cranes. There is a trip from Pittsburg to Stewart, thirty miles on a railroad, with glimpses of the points of interest en route. There is a scene of East Pittsburg depicting the evening exit of 9,000 employees from one big factory.

Biograph interiors have always been regarded by photographers as an impossibility. In order accurately to reproduce motion a camera speed of 900 pictures a minute, or 15 a second, is regarded as necessary. Up to the time of the perfection of the mercury vapor lamp, the invention of the son of the late Abram S. Hewitt, of New York (which was described in *THE AMERICAN EXPORTER* a year and a half ago, when it first came out), nothing but clear sunlight or the massing together of an enormous number of arc lamps made such shutter speed possible. To erect 400 arc lamps in order to obtain a single interior motion picture in a shop or factory was out of the question. The expense of such an arrangement and the impossibility of obtaining sufficient electric current for such an installation in all but a few places were the barriers that stood between the biograph picture and wide success. The mercury vapor lamp has removed the barrier. A comparatively small number of the vacuum tubes shedding forth their brilliant greenish light will make biograph pictures possible in the blackest workshop. A number of these lamps suspended in series may be carried down a factory aisle in advance of the camera, wherever a factory is equipped with traveling cranes overhead, and mutoscope panoramic views of the entire length of a long building's activity may be obtained.

The biograph picture thus comes into prominence as a live competitor of the still print in all advertising and publicity work. Boards of directors, who have not recently visited the industries which they control, may have displayed before them at any place the working conditions as they existed in their properties at any desired date. Scenes on a theater stage may be perfectly reproduced. Every gesture of the platform orator or the pulpit preacher may be caught for all time. An hour in the life of any prominent man at his desk or the general activity of any newspaper office or commercial shop may be shown on the lecture platform at comparatively small expense.

Royalty Declares World's Fair Wonderful.

PRINCE GEORGE and Prince Konrad of Bavaria last month visited the American World's Fair. The princes were enthusiastic over the Exposition. "I am very favorably impressed with the city of St. Louis and the Fair," said Prince George. "My brother and I have had a delightful stay. The magnitude and beauty of the Exposition impressed me most. The Fair is so large and beautiful that one almost loses sight of the elegant exhibits in all the buildings.

"I was particularly pleased with the illumination of the buildings at night. I have never seen anything prettier than the St. Louis World's Fair buildings when outlined at night with their millions of electric lights. The whole scope of the enterprise has deeply impressed my brother and myself, and we believe the American people deserve much credit for what they have done. It was

quite gratifying to see the splendid exhibits of Germany. Germany seems well represented in every department of the Fair, which is a source of gratification to all her sons. I am sure that Germany will send many visitors to see what awaits them at beautiful St. Louis."

Mexico at the American World's Fair.

RICH natural resources, varied industries, expanding commerce, high national ideals—in these words may be summarized Mexico's showing at the American World's Fair. Both American and British capital is being steadily directed into Mexican mining, and during the next few years a great advancement is assured. But this is merely one of the many indications of national prosperity. The observer has only to inspect the fibers in the Agricultural Building, the timbers in the Forestry Building, the railway works and harbor works in progress, as shown in the Palace of Transportation, to realize that the Republic, under stable government, is steadily advancing all along the line, showing conclusively that nearness to the United States is a decided benefit to the country.

The Mexican pavilion is one of the most charming buildings in the World's Fair grounds. It occupies a place of prominence, its architecture is chaste and elegant and it has surrounded itself with a wealth of beautiful shrubs and flowering plants characteristic of the country. The interior is even still more artistic, but comfort has not been sacrificed to mere adornment, and the pavilion has become a favorite resting-place all day long for throngs of visitors. There is much to see and admire—the magnificent floor of mosaic tiles, the luxurious furniture, the windows, some of them in stained glass and others reproducing by photographic process choice glimpses of scenery. But the moral of the whole is that everything in sight is from Mexico, showing that the country stands high in modern artistic handicrafts.

Throughout the Exposition Mexico has adopted the principle of collecting exhibits. There is no attempt to advertise the names of individual producers or manufacturers. The articles displayed are simply representative of the nation—carefully selected and effectively grouped. And to give the fullest advantage to this admirable system, the Government has erected in every building a special pavilion, rich and ornate in design, draped with the national flag and catching the eye of the sightseer from long distances. The Mexican commissioners certainly have carried out their task with admirable taste and judgment and with the most complete success. With eleven separate courts, each covering an ample floor space and filled to repletion, any exhaustive cataloguing of the exhibits within the limits of a newspaper article would be impossible.

Germany's Imposing Exhibit at American Fair.

AMONG all the foreign nations exhibiting at the Fair only Germany matches Japan in richness and splendor of display, writes James Glen in the *August World's Work*. All the unequaled sweep of German education, classical, medical, technical, scientific, historical, is shown in models, appliances, specimens and pictures with unprecedented minuteness. Germans can teach each other how to live—German rooms, German carpets, German furniture, German ware, German food, German drink are lavishly presented with suggestive effect. Five-sixths of the German domain is in colonies over-sea; the methods and results of German colonial development are made clear in interesting object lessons. German art shows an uplift; its evidences are here. By the direct command of the German Emperor—in some measure to reciprocate the American hospitality to Prince Henry, but mainly to tell America what Germany is—the German nation has outspread its resources and achievements in a picturesque and significant array. Wherever the red and black and white colors entwine the pillars of a section at the Fair, or the black Prussian eagle hangs overhead—and this is almost everywhere you turn—German genius has exploited itself richly and instructively.

Panama's Progress Paved with Our Cash.

JUDGING from a brief report forwarded to the State Department by United States Consul Gudger, at Panama, it would seem that the spirit of progress has been aroused in the new Republic of Panama by the receipt from the United States of \$10,000,000, the amount due on account of the interoceanic canal contract. Large sums have been appropriated by the National Assembly for public works of magnitude in each of the seven provinces of Panama. By the middle of August the President of the Republic will have despatched engineers and architects to the several provinces to prepare plans and specifications for the contemplated works. These are to be submitted by December 31st next.

An important feature of the act of the Assembly is that it gives the President the right to admit free of duty all material to be used in these public improvements. The scope of the works includes the erection of houses for the governors, police stations, schools, prisons, hospitals, boring artesian wells, erecting bridges of iron and wood across rivers and streams, opening up public roads through the interior, cleaning harbors and opening up rivers, establishing electric plants in municipalities and erecting lighthouses.

It will be seen that the Republic of Panama promises in the near future to afford not only a field for the efforts of adventurous mechanical workers, but an extensive market for many kinds of raw and manufactured materials produced in the United States and abroad adapted for the purposes indicated.

MICHAEL'S LAWN SPECIALTIES

Have been on the market over 46 years,
and have successfully stood the test of time.

Our Motto Is: **QUALITY** in Every Instance.

New Michael Lawn Swing.

For grace, solidity and beauty the New Michael Four-Passenger Adult Lawn Swing has no equal. All parts are bolted or screwed. We use no nails except in chair slats. No tools required in setting up. We guarantee the New Michael Four-Passenger Adult Lawn Swing to be the best made. Opens and closes like a jack-knife. Contains about 20 cubic feet each, and weighs, each, 150 lbs.

Price, per half dozen.....\$30.50

Michael's Folding Rocker.

Is the neatest and best article ever placed before the people. Folds as shown in cut. Painted red or green, or natural wood finish.

Six Folding Rockers, crated, containing about 14 cubic feet; weight, 48 lbs.

Price, per dozen.....\$9.00

Michael's Lawn Settees and Folding Chairs.

Our Lawn Settees and Folding Chairs are the most practical ever placed upon the market. The curve in back is exactly right. Painted red or green, or natural hard-wood finish. Six 5-foot Settees, crated, containing about 25 cubic feet; weight, 96 lbs.

Price, per dozen.....\$18.00

Six Folding Chairs, crated, containing about 14 cubic feet; weight, 30 lbs.

Price, per dozen.....\$6.00

NOTE.—The prices above quoted are f. o. b. New York City.

We also make the **Michael Porch and Lawn Reclining Chair.**

C. H. MICHAEL MFG. COMPANY,

Cable Address, "Michael." Western Union Code.

LA PORTE, INDIANA, U. S. A.

MILLING CUTTERS

**SPECIALLY MADE FOR HIGH-SPEED
MILLING AND ACCURATE FINISH.**

Visit Our Exhibit, Block 13, Machinery
Hall, Louisiana Purchase Exposition.

**BECKER-BRAINARD MILLING
MACHINE CO., Hyde Park, Mass., U. S. A.**

228

**NATIONAL
SUPPLY CO**

PITTSBURG PA

MANUFACTURERS OF

ALL KINDS OF SUPPLIES

FOR

**OIL AND GAS
WELLS.**

**Derricks and Rig Irons,
Boilers and Engines,
Drive Pipe Casing and Tubing,
Drilling and Fishing Tools,
Manila and Wire Rope,
Pipe Line Supplies.**

We furnish Complete Outfits ready for drilling.

We give careful attention to export orders.

"Booze" in Business a Lost Art

A FEW months ago we printed an editorial showing the decrease in liquor-drinking as a means of creating or doing business. The last issue of the *Shoe and Leather Gazette* has an interesting article following up the subject. It should be noted that the word "booze" is a colloquial expression, which means intoxicating liquors. What the *Gazette* says is partly a repetition of what we have previously printed, but it is none the less worth using as showing one of the reasons for the progress that this country is making:

"It is evident that the art of mixing 'booze' and business is rapidly becoming a lost art. There used to be chaps who could carry a heavy load of business, floated in liquor, who seemed really to sail better when loaded to the line with wet goods, but they are now rare. The trouble about combining the two is that this age demands specialization. A man must be all one thing, as near as he can, if he wants to make a mark. If he wants to succeed in business he must not divide his time. If he wants to become an exponent of the distilling or brewing business, he can get along much better by devoting his whole time to the job.

"Business methods have changed in regard to the use of liquor as a lubricant in business. It used to be that the man with the greatest tank capacity was the one to send to certain localities to sell goods. Some States appeared to have their business affairs all in the hands of men with well-developed appetites for liquor, and the salesman who traveled there had to be a good fellow. Such communities are now scarce, and growing scarcer. Merchants whose trade is worth having are not to be cajoled into giving orders through the medium of a few fine samples of exhilarating waters. The merchant of to-day wants to be thoroughly sober when he buys goods, if he is half full every other day of the week. In fact, it is very advisable that he should be in a cool, calm, calculating state of mind. So the salesman whose principal characteristic was his capacity for alcoholic assimilation has gradually dropped down the list. He is seldom called for.

"And it is not only in traveling salesmanship that the non-drinker (or at least the man who does not make a specialty of it) has slipped along toward the front of the procession."

A recent issue of the *Topeka Merchants' Journal* has some thoughts on this line in which it largely confirms what the *Gazette* asserts on the points mentioned. It says:

"The new mayor of Kansas City, Mo., U. S. A., has announced that no man who gets drunk will hold a job under the city government of Kansas City if he can help it. There was a time when a mayor of a town like Kansas City would not have dared to make such a statement, but as people learn more sense the 'boozier' is going out of business all over the country.

"The biggest railroad companies won't hire men who are known to drink, and other employers are following the example of the railroads. No man is fit to do good work when he is full of budge, to say nothing of the money he wastes.

"High wages and short hours do not help the man who gratifies an appetite for 'booze.' The other day we were talking with one of the Kansas World's Fair commissioners regarding the laborers who work on the St. Louis Exposition buildings. Many of them make from \$8 to \$16 per day, but a good many of them spend at least three-fourths of that amount on 'booze,' and when the summer is ended few of them will have a dollar ahead."

American Army Is a Great Commune.

CAPT. W. E. FRENCH, U. S. A., has contributed to the *Arena* a remarkably interesting article regarding the standing army of the United States.

The subject is treated from a point of view that is entirely original, and even those of our readers who are not interested in armies will find it worth reading. Captain French says:

"There exists to-day in our country a practical, working model of a socialism on a small but by no means minute scale, backed by a paternal government and differing superficially only, except in one important but readily modified particular, from an almost ideal commune. It has been running smoothly for over a century, comprises about sixty thousand people in its regular establishment, and perhaps twenty or thirty thousand that are of it but not in it, although enjoying many of its privileges, and at one time it had a membership of over two million. This socialism has its being in an organization that is popularly supposed to be, and in some respects is, a despotism—a case of the lion lying down with the lamb inside, or of 'out of the strong cometh forth sweetness,' the lion in this instance being the United States army.

"The United States is our employer, taskmaker, paymaster and most kind and considerate public parent. We live on Government land and in Government houses, the use of both being part of our perquisites and both being kept in order free of expense. Our pay is generous, our work (in time of peace) not arduous, and each is supposed to be proportioned to our respective abilities and to age and length of service. We are allowed, gratuitously, the use of land and water (all the natural opportunities, in fact) but are not permitted to employ them for purposes of speculation, extortion or monopoly, nor must we use them to exploit labor or the public. We enjoy free certain other valuable allowances—comfortable, artistic, modern shelter; medical and surgical attendance, including nurses, appliances and drugs; transportation when trav-

eling on duty, with a fair baggage allowance and sufficient mileage to cover all extra expenses; ice where it can be harvested (at cost where manufactured); ordinary household repairs; access to tools and machinery; music of a high grade; a fairly comprehensive library; golf links, tennis courts and ball-grounds, toboggan slides, skating rinks and swimming pools; a chapel with a salaried chaplain and no pew rent, and an amusement hall, which is always a fair ballroom and frequently a tolerable theater. We may buy of the Government, at net wholesale rates, food, fuel, light, clothing (all free to the enlisted man, being a portion of his rations and allowance), weapons and certain articles of furniture. We are furnished with stoves, furnaces, ranges and cooking utensils; provided with feed for horses when on mounted service; allowed commutation of quarters (house rent) when on duty outside of a garrison, and given one month's holiday or leave of absence every year, which vacation may be accumulated for four (practically five) years, the cumulative leave being on full pay, additional on half. During illness, or while on what we call 'sick leave' (no matter if it be for years), we are on full pay.

"At the age of 64, after thirty years' service (discretionary with the President), after forty years' service (obligatory if application be made), or when injured, mentally or physically, in the line of duty, an officer is retired on three-quarters pay; an enlisted man after serving twenty-five years.

"It is to be plainly seen that rent, fire and endowment insurance, taxes, water rates, repairs, competition, mutability of employment, ill-health, portionless old age, strike, lock-out and injunction, or most of the cares and troubles that shorten the life of the average human being, are not factors in our military lives."

New Methods in American Business.

SUCCESS is something that everybody is striving for. In America we have a paper called *Success*, and it has this to say about changes in business life: "It has become an unwritten, but none the less stringent, law, that young men shall dress well and neatly during business hours. In many of the largest banks and financial institutions none of the clerks is permitted to go coatless, and in the mercantile establishments where salesmen are employed 'loud' attire is actually discouraged.

"The old-time salesman gloried in his flamboyant cravats and shirts, his diamonds and his peculiar clothes. His capital-in-trade consisted of a flashy appearance, vulgar stories, a constitution that would stand intoxicating liquor and an unlimited amount of cheek. He did not have to know anything about the goods he sold, except in a general way. He slapped men on the back, took them out to dinner, got drunk with them and then booked their orders.

"On the contrary the modern salesman is a well-educated, neatly dressed gentleman, who knows all about the goods he sells. He is never called upon to drink, he never needs to dine out, he trades on honor and brains, and his customers are men who only admire men who know as much, or more, than they do about their business. Dress plays the most important part in the game of commerce, no less with the salesman than it does with the manufacturer, the mill man, the banker, or the financial man. They all dress to impress their fellow-men favorably."

Have the Japs Discovered Dundonald's Secret?

THE invention of Shimose, the new Japanese explosive, by the professor of that name, says the *American Inventor*, recalls the famous Dundonald invention, never made public and still supposed to be sleeping in the archives of the British War Office. This invention, the nature of which was never made public, was stated by contemporary reports to be so deadly and so inhuman in action that until driven by extremity the British war lords would not use it. Its use was proposed first during the early Napoleonic wars, and in every war since then the question as to whether or not it should be employed has been considered, but always in the negative. At least, so says the foreign press. But it is a matter of wonder whether any nation, having in its hands the means to annihilate an enemy, whether by an invention deadly, more deadly, or most deadly, would refrain from its use simply because the employment of it would mean an inhuman loss of life. It may be that such is the case, but common belief will run to the hypothesis that the Dundonald invention is a canard.

South Africa Likes American Implements.

AMERICAN agricultural implements are well liked in South Africa. Consul-General W. R. Bigham, at Cape Town, Cape Colony, has the following to say on the subject: "The inroads being made in the trade of this colony by American agricultural implements and the fact that the South African farmer recognizes their excellence and will have them if he can secure them reasonably have excited a good deal of jealousy in the minds of the British merchants here. The mere fact of a British brand on an implement or machine will not capture the farmers here. They want the best, regardless of where it is manufactured. As I do not live in an agricultural district I am not able to say to what extent the different agricultural implements could be sold, but I am told the American hand and sulky plows are very much admired by farmers in the Orange River Colony and Natal, and I am safe in saying that the only requirement to make them popular is a proper introduction. Stock must be kept on hand here."

"1900 Junior" Washer.

A REMARKABLE RECORD!!!

Commencing in the year 1900 to manufacture the "1900" Washing Machine, we at that time
"turned out" an average of Five Washers per day. During the month of August, 1903,
we manufactured and sold OVER FOUR HUNDRED Washers per day.

A REMARKABLE RECORD!!!

REWARD OF MERIT!!!

REWARD OF MERIT!!!

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-one years' practical experience
in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment**, but by the adoption of our
agitator tosses and tumbles the garment through a **whirlpool of water**, thus forcing the water through the **finest or coarsest fabrics**, causing
the clothes to become **ABSOLUTELY CLEAN**, without boiling or scrubbing, without wear or tear, and without the use of chemicals.

SPECIAL OFFER FOR FOREIGN MARKETS ONLY:

\$22.75 Upon receipt of Twenty-two Dollars and Seventy-five Cents in U. S. gold, or its
equivalent, we will box, ready for steamer, and deliver F. O. B. cars at New York City, **One**
of Each (Four in All), "1900," "1900 Junior," "Domestic" and "Home" "1900" BALL-
BEARING WASHING MACHINES. Weight of the four machines, boxed 300 pounds.

To facilitate our increasing export trade we desire to communicate with one responsible business house in each trade
center of the world.

Tens of thousands of the "1900" Washing Machines have been sold in the United States, as well as in all parts of the
world. Many of our agents at home are making over \$200 per month. Live men in your vicinity can do as well.

Orders received direct or through export houses; when ordering through the latter, to avoid errors, please mail us duplicate of order. Our
Illustrated Catalogue mailed postpaid.

The "1900" WASHER COMPANY

BINGHAMTON · NEW YORK · U.S.A.

Great Congress of Electrical Engineers.

ELECTRICAL engineers from all parts of the world will come to America next month to take part in the International Electrical Congress, to be held in St. Louis, September 11th to 18th. The engineers will have opportunities to acquaint themselves with the remarkable developments of electricity on American soil.

The congress is held under the auspices of the Louisiana Purchase Exposition and will contain Government delegates, while seven American electrical bodies and several foreign societies of the same character are cooperating. The interest in this congress, which is the lineal successor to that of Paris in 1900, may be gathered from the fact that already nearly 1,800 adhesions have been received and 150 papers promised from some of the most celebrated electricians and physicists. Of this number a large proportion are Europeans, and the vanguard from the other side is expected to arrive the last week in August, when a body, about 150 strong, is to land in Boston, recruited entirely from the British Institute of Electrical Engineers.

About the same time a party of about 100 from Italy will land in New York, and from here the whole party, including many others arriving about that time, will leave for St. Louis by special trains. The party will not go directly to the congress, but will visit Schenectady, Montreal, Niagara, Buffalo and Chicago. The great electric lighting, street railway and power transmission enterprises at these American cities will be inspected and the delegates will be entertained by the respective managements.

After a week of congress work in St. Louis, from September 11th to 18th, the visitors will go to Pittsburg, and thence to Washington and Philadelphia, and while at Washington will assist officially in the dedication of the recently erected office and laboratories of the United States Bureau of Standards, at which time President Roosevelt will participate.

On the return to New York at the end of September the party will break up and proceed homeward at will; but a trip is planned to some of the interesting points in the vicinity, including the Edison laboratories. Before the party starts from New York for St. Louis it will be officially the guest of the American Institute of Electrical Engineers, and a dinner will be given at a prominent New York hotel.

Electricity Invades Manufacture of Organs.

ELECTRICITY has invaded every science and almost every art except music, which has remained under the sovereignty of the physics of air for many centuries. Now air, mighty as it is in stirring the soul to its depths by arousing the grand passions through the medium of sound, has at last succumbed. In Festival Music Hall at the World's Fair in St. Louis (U. S. A.) there is now to be seen the largest organ ever built in the world.

The instrument was designed and built at Los Angeles, in the American State of California. Fleming's patent electro-pneumatic system is utilized for producing many marvelous results. In this mighty organ there are 10,059 pipes, and from various combinations of these sounding pipes there can be produced 17,189,869,183 distinct tones.

To the visitor the first view of this remarkable instrument of sound is wonderfully impressive, since it is as large as a house, its exact measurements being 62 feet in length, 40 feet in height and 33 feet in width. With its 140 stops and 239 movements and 10,000 pipes, it will require the greatest organ virtuoso to make it respond with anything like the volubility of which it is capable.

This great organ is really composed of five separate organs, each of which forms a complete organ in itself, and these are so arranged that any or all may be instantly brought into action. These different portions have been named, respectively, the grand organ, choir organ, swell organ, solo organ and, last and most wonderful of all, the echo organ. Of the 10,000-odd pipes over a thousand are utilized for the sole purpose of imitating stringed instruments, and to make these give forth the proper sound the pipes are made of pure tin.

The electrical equipment for operating, controlling and actuating all the complex mechanism involved in this instrument includes two 10-horse-power motors for working the bellows and a special motor of 1½ horse-power for driving the bellows of the echo organ. The electro-pneumatic system of the organ contains 1,300 magnets for manipulating the key and draw-stop actions. In these magnets 130 miles of wire was used. There are five automatic electric swell engines for actuating the swell shutters, and there are more than 7,000 electric circuits controlling the varied mechanical devices.

Advances Made in Manufacturing Motors.

SO general has the use of machinery become in the last decade and so diverse are the uses to which mechanical devices are now applied in America, both for home and export trade, that manufacturers are prepared at short notice to supply large or small machines for any required purpose. Methods of applying power for driving the machines have kept up a corresponding pace with the machines themselves, so that it is now possible to purchase motors from one horse-power up. These may be electric, gasoline, hot air or steam. If the conditions are such that electricity can be had without interruption electric power is without doubt the most convenient, but otherwise the gasoline engine possesses the advantages of being the cheapest and easiest to care for, and calls for no special skill to control. Steam, while

reliable and cheap, requires special knowledge to run, and is the most expensive at the outset, but as all can be had of low horse-power it makes it possible to fit up a small plant at a light expense, and as machines are constructed for general lines of work a few hundred dollars would be sufficient capital for fitting out a small factory. In times past, when machines and power were more expensive than now, the cost was so great that unless the machines were kept running all the working hours they could not be run without loss. The one advantage that electricity has over all other power is that a small motor can be installed at any machine, and when that is not running there is no cost, whereas with fuel machines the power must be kept up all the time that the running of any one machine is necessary. This advantage has caused the use of electricity in many plants where numerous machines are used.

Ingenious Engineering Feat in a New York Tunnel.

AN ingenious piece of engineering work, the double tunnel under the Harlem River, through which the rapid-transit trains of New York's new subway will pass, is almost completed and soon will be available for traffic. Of the twin tubes' total length of 1,500 feet, a distance of 692 feet runs directly under the bed of the river. This section has been constructed on a novel plan calculated to do away with the dangers and delays and other manifold inconveniences inseparable from work carried on beneath the water.

The tunnel consists of a pair of steel tubes which rest on a foundation of piles in the soft blue mud of the river bed 40 feet below the surface. These tubes are 16 feet in diameter, the upper halves of which are put together in segments on a pontoon raft and lowered down in lengths of 90 feet at a time. These lengths are closed at the bottom and the ends, so that they contain air. Then the arched twin tops are covered over with concrete until the top is flat. They are lowered down upon walls of tongued and grooved sheet piling, 32 feet apart, upon which they fit accurately.

Mr. Naylor, the engineer in charge of the work, in a recent interview thus explained the methods by which accurate work so far beneath the surface was insured: "The piles," he said, "are long timbers, each 12 by 12 inches. Their ends are driven 6 feet below the plane on which the bottoms of the tunnels will rest. The tops of the piles are cut off on the spring line by the sawing-machine on the working platforms. The tracks on which this machine traveled were given the exact pitch or grade of the tunnel, and then by preserving the same reach of the saw shaft the circular saw was made to cut the piling exactly on the spring line of the tunnel. When the tunnel tops rest on the walls we bolt them fast and then dig out the mud from under the semi-circular roof thus provided. We next assemble and rivet together the segments that form the lower half of the tunnels."

Railroads Have the Progressive Spirit.

RAILWAY progress in the United States comes now to be marked by decades. It may seem to be a surprising fact that the great industrial progress of the country within the past ten years has made necessary the rebuilding of practically every trunk line of railroad within that time, but it is, nevertheless, true.

"Most of the equipment of a decade ago," said H. L. Stone, writing in the *World's Work*, "is now in the scrap heap." This replacing of the old equipment has been made necessary by heavier locomotives to pull heavier loads, heavier rails to bear the heavier weight, and heavier bridges.

One locomotive now does the work which years ago was done by three. In 1892 the average weight of a passenger locomotive with the tender was 75 tons; the latest type for the same service weighs only 8 tons less than twice as much. The famous "999" shown at the Chicago Fair by the New York Central, and regarded as the wonder of the railroad world, weighed 102 tons, but the big fellows of this year that pull the passengers weigh 150 tons.

Passenger trains at present of sixteen cars are not rare, nor are freight trains of eighty cars. On short trips 100 freight cars are not regarded as too much. The latest type of compound freight engine weighs 181½ tons and will haul 8,000,000 pounds of freight.

London Tests American Divining Rod.—The apotheosis of the divining rod of the ancients is found in the invention of an American, recently tested in London. His device consists of a means for sending electric currents through the soil and connecting the wires with a telephone receiver. Making and breaking the circuit causes a tapping in the receiver and the variations of the sound of this tapping are said to be directly dependent on the amount of mineral or metal in the earth through which the electric currents pass. The invention is owned by a company which expects to make a great deal of money by locating mineral beds without digging for them until the instrument has located the metals.—*American Inventor*.

America's Rivalry of Europe.—The *Berlin National Zeitung* says: "America is becoming a keener rival of Europe every year. When the Panama Canal is opened the field of battle will be in South America and Eastern Asia. There the interests of Germany and Great Britain are seriously threatened in an equal degree, and both countries will therefore be dependent upon one another in future possibilities."

JULIENNES

LATTICE POTATOES

Some Queer Facts About Ocean Cables.

EVERAL thousand men are constantly engaged in cable work—laying, making, repairing, operating. An English newspaper once spent \$1,600 for a cable account of an Australian cricket match. The London *Times* correspondent in Melbourne during a famous murder trial far exceeded his toll limit of \$1,000 per day.

Cablegrams from Manila during the Spanish-American war and from Martinique after the eruption of Mont Pelée cost the New York papers many thousands of dollars a day.

Cables are broken by whales, by submarine explosions, by dragging anchors.

Once an Atlantic cable was wilfully cut, and once \$250,000 was expended on a single repair job.

To keep London and New York brokers in communication involves the exclusive use of a \$3,000,000 cable and a system of land line costing about \$250,000 per annum, ten sets of costly cable apparatus and a highly trained staff of 100 experts.

One cable operator traveled in ten years 60,000 miles and worked in a dozen countries. Operators think nothing of a jump from London to Chili. Most cable offices are in healthy, pleasant places. But Santos, Brazil, and the West Coast towns of Africa are deadly. In some of the latter colored operators alone can endure the climate.

Ciphers and "codes" multiply an operator's perplexities. Some ciphers compiled by a writer in the London *Empire* follow. An ambassador's:

BRITISH AMBASSADOR, CONSTANTINOPLE.			
39614	53481	08359	60017
49620	20395	98201	88563

SECRETARY.

The Turkish diplomatists, who enjoy the reputation of being the wildest negotiators in Europe, communicate telegraphically in the following cryptogrammic jumble:

OTTOMAN, LONDON.
xw3rbsly12zdps39ukw25jdz17gd21w8ff

AHMED.

The Chinese and Japanese have a series of pretty little brain-twisters in the shape of squares, triangular, and even round, codes. Of course, they also use cipher, as in this Chinese puzzle:

KWONG CHANG, WASHINGTON.				
h2fk	13oq	2d5z	j7kx	dh2k
c4wd	x3zk	iz3g	a3si	wp4z

WUN LUNG.

One of the queerest messages ever sent was cabled by a facetious Yankee with a fat pocket book who had witnessed a royal departure from London. It ran:

"Victoria left for the Continent to-day. She took with her forty-seven traveling trunks, one bed, two mattresses, one donkey, one princess, one nigger attendant, one Scotch Highlander, six white servants of divers sexes, one Cabinet Minister, three boxes despatches and books, four dogs, two cats and one chaplain!"

A number of specialists have developed who are called "packers," and whose business it is to take cable messages and reduce them to one-word ciphers. The cable companies charge double for words of more than ten letters. But the "packers" do not much mind the limit with eight languages to draw upon.

Press despatches are not codified, but are usually skeletonized. Such a hodge-podge as this:

"Parisian 29 x.—Disgaoth Swa Kim stags abysmins agan attached Bakalch forge 50000, men repulse engrmous losses. No farther dytails cattle gwen hispotch"—

is translated into the following intelligible paragraph:

"PARIS, Jan. 29.—A despatch from Suakin states that the Abyssinians have again attacked Makaleh with a force of 50,000 men. They were repulsed with enormous losses. No further details of the battle are given in the despatch."

This is an actual instance, but despatches are seldom quite so badly "mixed up."

American and European Trade Characteristics.

A WRITER in the *Engineering Magazine* makes these observations, which are interesting, whether we agree with his views or not: "The

European is not generally an expert in creating a market or demand for new things, but he thoroughly understands the necessity of meeting the requirements of every existing market and all the peculiarities incident thereto, and he constantly does it most admirably.

"The American is expert in introducing new things and creating a demand therefor, as is evidenced by his success with sewing-machines, typewriters, popular cameras, agricultural machinery, etc., abroad; but, despite the fact that, as stated, he has at command the personnel, manufacturing methods and natural resources to best meet the requirements and peculiarities of any market, he is usually inclined to the theory that American practice is right in everything, and that the foreigner can easily be convinced thereof, and he hesitates to furnish exactly what may be required by the foreigner, or to supply it in the manner in which it may be desired. He is surprised that the for-

eigner is seemingly obstinate in his theories, and forgets that it comes through traditions and familiarity with some certain practice, or that, as is frequently the case, local conditions actually necessitate something at variance with ordinary American practice.

"European industrial methods, laid out to meet the requirements of international trade, have hampered standardization, but have developed methods for the economical production of special work. American methods have produced the perfection of standardization, but have operated against the most economical production of special work. A happy combination of economical production on both these classes of work would, of course, be the ideal condition. Owing to his natural versatility and his possession of the elements which he has at his command it is but natural to conclude that the American will reach this ideal condition when he is forced to do it through the necessities of trade."

Big American Fresh Water Ship's New Features.

SEPARATING the United States and the Dominion of Canada is a chain of great lakes, of which little is heard outside of the North American continent. An extensive commerce is carried on by means of the vessels plying the waters of these lakes, and some of the steamboats measure up to the standard of the second-class ocean liners. As showing the development of this branch of American effort it is worth noting that a new steamboat, 60 feet larger than any now in use in this traffic, is being built for the great lake trade. Heretofore boats 500 feet long have been considered ample. The building of the new boat marks a revolution in lake commerce, for it was supposed the maximum in the size of lake vessels had been reached in the 500-foot boats.

The new vessel will have a beam of 56 feet, a depth of 32 feet; her keel measures 540 feet, and she is to have 32 hatches. The engines will be of the quadruple expansion type. The total cost is estimated at about \$500,000, and of this amount it is said that about \$150,000 will be paid out in wages. The building of such large ships necessitated the extending of one of the regular berths at the yards about seventy-five feet.

The construction of the steamer is perhaps as remarkable as her length. Nothing like it has before been attempted on fresh water. The interior of the hull will represent a tunnel more than anything else. There will be no bulkheads or freight compartments as in other boats, but the whole hold—the freight-carrying room—will be one vast compartment. The arches which support the main deck, it is said, will strengthen the boat more than would bulkheads and special braces. It is figured that the new ship will carry 10,000 gross tons of cargo with an 18½ foot draft.

The arrangement of the hatches is to be such that the unloading of ore or wheat may be done with the utmost dispatch. With this end in view, not only the hatches but the bottom of the boat as well come in for improvements. The latter will be a hopper bottom, so that the cargo can be reached with the clam-shells or buckets without delay.

Eggs in America Handled as Safely as Iron.

WHILE eggs are extremely fragile things, they are handled in the American trade with almost as much safety as pig iron or pine lumber. "You would be surprised to learn how few eggs are broken in handling," remarked a New York commission merchant the other day. "As a matter of fact, the breakage of eggs in transit and in handling is extremely small, really next to nothing. The commercial egg package almost universally used throughout the country at the present time is a case containing thirty dozen. There were received in New York last year 2,869,269 cases of eggs. Multiply that by 360, the number of eggs to a case, if you care to know the total number of eggs.

"Packed in cases eggs run about four hundred cases to the car, so that the eggs brought to New York last year made upward of 7,000 carloads, equal to 140-odd solid trains of eggs of fifty cars each. Are there solid, or exclusive, egg trains? Not many, but this for the reason that the eggs are gathered originally from many and widely scattered points, but solid cars of eggs and bunches of cars are common, frequent, every-day shipments. And, packed as they are nowadays, eggs for this market come from everywhere, pounding over a thousand, fifteen hundred, two thousand miles of railroad from as far north and west as North Dakota, and from as far south and west as Texas, with scarcely any breakage worth mentioning.

"If anything does happen to eggs in transit or handling it is likely to be in the nature of an accident such as might happen to anything. For instance, a case of eggs might work out from under the rope around a truck load, or a case of eggs might fall out of a wagon, or an axle might break and let a load of eggs drop. In fact, eggs are carried on American railroads with practically no more chance of breakage than less fragile commodities."

All of which shows what Americans have been doing in the transportation line in recent years, as well as in other spheres of activity.

Largest Gas Company in the World.—There is a natural gas company in the American State of Pennsylvania which supplies 64,365 consumers and furnishes 40,000,000 cubic feet of gas to its customers. In the last year it gained more than 25,000 consumers, and its earnings increased nearly 100 per cent. Much of the gas is supplied to industrial concerns. Who may now say that the American section is not much more than holding its own in the world's progress?

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 3/4 cubic feet. This cut represents the **entire line** of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/2 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is **SMALL**. All parts are **INTERCHANGEABLE**, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in **PERFECT CONDITION**, as no possible damage can occur to **FINISH AND NONE OF THE PARTS CAN SWELL OR WARP**, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

Marvels of Modern Steamships.

PASSENGER steamships which ply the big oceans have been improving right along. These ships are only collateral instruments in the work of advancing the volume of international trade, but they are none the less interesting. The *New York Herald* in a recent issue devoted an entire page to this subject, and some extracts will be found of general interest, even to merchants and others who have traveled on the liners. The *Herald* says:

"A modern ocean liner is commonly said to have all the comforts of home. The comparison is extremely unfair, however, to the liner, unless the home in question be that of a millionaire and of a man of taste and advanced ideas in the bargain. A great ocean steamer is absolutely self-contained. For completeness in providing every comfort and luxury no hotel, clubhouse or private residence in the world can stand comparison. A great liner is actually an iron continent, where perhaps 3,000 or 4,000 people assembled from every grade of society may live for a month, if necessary, and enjoy more than the comforts of home.

"A modern liner is such a hive for activity and so much is crowded beneath a single roof, or rather deck, that few ocean travelers ever come to know these floating palaces really well. The mechanism which enables the population of a small city to live at sea without any interruption of the daily routine of land life is extremely complex. From the time in the early morning, when the passenger may telephone from his stateroom to a fellow-passenger or to order a special dish for his breakfast, throughout the day, with its newspaper, its concerts and all the hundred opportunities for passing the time pleasantly, to the concert, ball or card party at night, with afterward a possible theater supper in the grill-room or Vienna café, the great boat would seem to leave nothing to be desired.

"How many of all the thousands who have crossed on the great liners have ever been inside the ship's printing-office? It is a picturesque little shop, fitted up much the same as any printing-office on land, with type cases and printing press, where the click of the familiar machinery comes as a welcome interruption to the incessant throbbing of the ship's engines. In the past year the ship's printing-office has gained a new interest. It has become a newspaper office as well. For years the great liners have been equipped with a small printing press for printing the ships' menus. The work required formerly but a few pounds of type, and this of one kind. The installation of the wireless system has given a new occupation to the printer. On the steamers of the Hamburg-American line, for instance, a newspaper is published every day.

"Within the last few days a new record of oceanic newspaper enterprise has been recorded. Ocean voyagers have not only been served daily with newspapers, but newspaper extras have been issued and called out, at least distributed, throughout the ship on the receipt of important news. There are at present upward of fifty steamers equipped with the wireless telegraph apparatus, plying backward and forward in the narrow ocean lanes. It is common for a steamer to be in communication with some other boat each day, and so the possibilities of picking up news from one side of the Atlantic or the other are many. The steward editor is seldom at a loss for some news items from the outside world, at worst not more than three days old.

"The ship's printing-office is usually an inside room and of the size of an ordinary stateroom, with the berths removed. The stands of type in these days of ocean newspapers pretty well fill the little office. The press is the same as used for printing the menus. The newspaper is the same size as these cards, or 8 by 4 inches. The press is worked by hand. The ship's printer is a regular steward, and, like them, wears the ship's uniform. He must, besides, have some qualifications which a landsman may never learn. He must be a good sailor. It is not enough that he should never be sick when a menu or a Marconi newspaper edition is to be run off. He must be able to work quickly with his office at an angle of perhaps forty-five degrees. The ship's printing-office is well worth a visit, especially when time hangs rather heavily on one's hands. The best time to see the office, it may be suggested, is in very rough weather.

"The great liners of to-day are equipped with a complicated system of electric communication, forming as it were a great nervous system, which serves to bring every part of the great fabric in touch. There are telephones which enable a passenger to call up a stateroom from the smoking-room, the café or the grill-room, or communicate with the captain, the purser or the stewards. The wheelhouse again is in touch by telephone with every part of the ship, so that the man at the wheel can communicate with the engineer with the least possible delay. There are besides electric signals to warn the bridge in case of fire, or for use in closing the compartments automatically in case of accident. Even an electric elevator is contemplated for the ships of the future.

"One of the least familiar and yet most interesting provisions of a great liner is its strong-room. Innumerable romances have been written in the past of ancient treasure ships of various kinds, and much tragic history has been made by them for centuries. As a matter of fact, many an ocean liner sails out of New York harbor with greater treasures aboard than did any of the Spanish treasure ships whose names have been famous for centuries. From time to time, a brief paragraph in the newspapers announces that so many millions in gold or silver left by such and such a steamer, and that is all. Few ocean voyagers, even veterans, have ever seen these strong-rooms. The great modern liners are as well equipped in this respect as most banks.

"In addition to this great deposit vault the ship is supplied with several heavy steel safes for the accommodation of the purser and the passengers. As in

any hotel, the steamship company is not responsible for valuables of any kind left in the stateroom. The passengers are free, however, to deposit articles of value in the ship's safes. The purser again usually carries a considerable sum of money, sometimes many thousands of dollars, and this, with the ship's papers, is carefully guarded. The smaller safes are often built into the walls of the purser's cabin. In the newest of the ships a great desk has been installed, exactly as in a hotel, and this again is never without its safe.

"The desk or office of the newest ships is itself a very novel feature which contributes much to the illusion that it is a hotel. It is placed at or near the main companionway. A long desk runs nearly the width of the ship, behind which the desk clerk stands smiling and obsequious, prepared to perform a score of unexpected services. The sailing list lies before him in lieu of the hotel register. There is a bell at his hand for summoning a boy to show you to your cabin or assist you in any way. Back of the desk extends long rows of pigeonholes, where you can leave the key to your room, if you choose, in the proper box. The desk is also the ship's post-office. You can mail your letters here for several hours after sailing, to be carried ashore by the pilot. The letters, which are brought aboard by the pilot or the tender at the various ports, are distributed here in the pigeonholes.

"Still another touch of luxury is the telegraph-office, installed at the desk. A bulletin announces whenever a wireless station or ship is in communication and until what hour messages may be filed. Such communication has grown to be almost continuous on the modern liners. For a day after leaving port or entering the next port of calling it is usually possible to keep in touch with land by the wireless telegraph.

"Even the pet dogs of the passengers are not neglected on the great modern liners. It is not enough that dogs should be stabled or kennelled somewhere below decks with whatever live stock may be on board. Many passengers demand that their pet dogs be treated with the dignity of passengers, with comfortable quarters above deck and in a position where they may receive daily callers. Every demand of the most exacting passenger is met on these boats, and the dog quarters are, therefore, irreproachable for comfort and location. Incidentally, a regular passage rate is demanded, and the requirements are seriously printed in the literature of the companies. The rate varies from \$10 to \$20, according to the steamer. On a five-day boat, for example, a higher rate is naturally charged than on a slow boat.

"The dogs' cabins usually consist of a number of commodious kennels placed on the boat deck. These kennels are, as a rule, large and strongly built, so that in the event of a chance wave striking them they are not likely to be broken. The kennels in the winter months are usually kept in the after wheelhouse, which is carefully warmed. In fair weather they are grouped picturesquely about the upper or boat deck, in the lee of the great iron ventilators or the life-boats, where they will be sheltered alike from wind and weather."

Would Double the Speed of Ocean Steamships.

AN American inventor has interested a prominent shipbuilder in a new "multiple electric propeller" which he believes will cut down the passage time of Atlantic Ocean steamships from six days to three days. While it is generally accepted that the present speed of ocean steamships cannot be much increased except at the expense of safety, the inventor's account of his discovery is given for what it is worth. The inventor is a machinist. It was while working at his trade that he evolved the idea of the multiple electric propeller. The device consists of a series of propellers arranged along the sides of a vessel, and driven at great speed by electricity. For a torpedo-boat destroyer the size of those at present in use in the United States Navy twelve propellers would be necessary, six on each side. In addition, single or twin screws could be provided, be operated alone or jointly with the side propellers.

"One hundred and fifty revolutions a minute is the limit of steam power, while my electric reversible motors can make 1,500 revolutions a minute," he said. "The power is transmitted by electric wires direct to motors built on propeller shafts. No belting or coupling is required, and the machinery is simplicity itself. I claim that there is practically no limit to the speed of the screw under this system. The only noise on the new vessel will be similar to that made by a flywheel in motion. Another advantage is that the terrific heat from furnaces and steam pipes will be avoided.

"A distinct feature is that the screws extend from stem to stern and thereby tend to maintain an equilibrium that will materially diminish the pitching and rolling motion of the vessel. The long shaft being disposed of, there will be no thumping and no jar will be felt from the horizontal motion. The most efficient turbine engine in the world will be used, which means a great saving in weight of machinery and in space now occupied by coal. Steamship propulsion now consumes 3,000 tons of coal, at a cost of \$18,000, a trip to Southampton. The electrical ship will reduce the coal consumption to 1,500 tons, being a saving of \$9,000 on each trip."

Cost of American Strikes.—In the last twenty years strikes have cost the wage-workers of the United States 3 cents a month. The average employer has one strike every thirty years, and the average strike lasts twenty-three days. Some unions have had no strikes for twenty years or more. It is said to be a rule that the strongest unions have the fewest strikes. A writer in the *Car Worker* says: "It is not fair to discuss strikes from the standpoint of an ideal society. In an ideal society there would be no strikes, no law courts, no trusts, no industrial warfare of any kind."

ANIMAL TRAP CO.,

Rat Trap.**LITTLE'S SATIN-FINISH CARBON.**

LITTLE'S CARBONS will not dry out under any ordinary circumstances, in any climate. No Carbon made under any other process than **Little's** can give this guaranty, and there can be no imitation of **Little's** process in carbon making; attempts to steal it have resulted in permanent injunction; and contempt of Court is an untried way to business success.

Little's famous brands, "Cobweb" and "Satin Finish," are known and used all over the world.

Little's Carbon Papers are better than all others because: They do not smut. Impressions from them in many instances can hardly be told from those made by a ribbon. They are not sticky or greasy, yet they do not dry out and do not spoil with age, or in any climate. They last longer than any others. The color is denser, stronger, more permanent than any other. It is evenly spread by automatic machinery.

Most other Carbon Papers look alike. **Little's** looks different. It is different, being made differently by a special process, and it does different work. Send for Catalogue.

Orders received through New York exporting houses at export rates.

AMERICAN HARVESTING.

Forty-Two Binders Working Simultaneously on One of Our Big Wheat Ranches.

SOME idea of the progress that is being made in America in the cultivation of the soil and the use of agricultural machinery can be gathered from the following interesting letter which is sent to us by a correspondent at Kansas City, which is close to the center of the American wheat-growing district:

"Harvest is just ending on the famous 101 ranch and the first carload of new wheat has been received in Kansas City. It came direct from the threshing-machine at Bliss, Okla. This year the Miller brothers, owners of the ranch, have harvested about 9,000 acres of wheat, the greatest number of acres of wheat that have been harvested in Oklahoma upon any one farm.

"The total number of acres of land cultivated on the 101 ranch is something more than 12,000, with wheat as the principal product. The entire ranch, including pastures, contains 70,000 acres. Of this vast tract the Miller boys own 4,300 acres, having purchased it from the Indians of the Ponca tribe. The balance they have leased from the tribe for a yearly rental.

"Their wheat yielded better this year than they expected, considering the adverse conditions of the winter and early spring. The average yield of the 9,000 acres will be about twenty bushels to the acre—perhaps a little less. Some varieties will show as high as thirty-five bushels to the acre, while some will only run about ten. The White Wonder wheat, a variety that was produced first by this ranch, seems to be showing the best results.

"For the last two weeks, or since harvest began, the ranch has been about the busiest place in Oklahoma. To handle this crop, forty-two binders were required and not fewer than 300 men to work the machines and put the wheat in the shock. Three hundred mules were necessary to pull the binders and the supply wagons and do all the hauling for the outfit.

"The Millers hired every man that appeared and wanted a job. Almost any kind of help could find something to do. The wages paid to the infantry, as the Millers call the men who shock the grain, was \$1.50 a day, with board and a place to sleep. To take care of the men, extra cooks were hired, and the ranch butcher killed a beef each day to furnish fresh meat for the workers.

"The wheat fields of the ranch are scattered all along the Atchison, Topeka and Santa Fé from two miles south of Ponca City to below Red Rock. The Millers have been very fortunate, the weather holding good for them during harvest, and their force of binders and men have taken care of about seven hundred acres of wheat each day they worked. The two largest fields on the ranch contain 3,000 acres each. One of these is seven miles around, and twenty-two binders were at work in it at one time.

"While this force of men has been busy with the harvesting of the wheat another force has been cultivating the corn. The ranch has only one corn patch and it contains more than a thousand acres. June 20th the corn was waist high and was receiving its last cultivation. Another force of men was put at work the next week making ready to thresh out the wheat. Five threshing-machines were put in the field to handle the crop. Twelve new wagons were ready to be put to work as needed, hauling the wheat to the cars.

"The 2,500 acres of land not taken up with wheat and corn will raise oats, cane, Kaffir corn and small products. One feature of the farm this year is a fifty-acre watermelon patch. This is about the amount the boys plant each year, and it supplies all the country round. No one else makes any pretense to plant melons, because they know they can have all they want by going over to the Miller patch. This patch will supply the whole Ponca tribe and any whites who want to gather the melons. There is no local market for melons, and that, together with the fact that it is easier to let the Millers plant them, cuts down the acreage.

"The expense account of the 101 ranch last year ran to more than \$60,000. The profits were large, although it is impossible to tell just what they were, on account of the new land bought, stock added and open accounts with dealers at the present time. The operations of this farm are reduced to a system. J. C. Miller is the farmer and looks after all the farm work, deciding what will be raised and attending to all the details of the work. George L. Miller handles all the accounts, looks after the commissary department, attends to the correspondence and makes himself generally useful in all the dealings with the Indians. Zach Miller is in full charge of the stock department and looks after the buying and selling of cattle, horses and mules. He spent some time when he was young at a military school, and defines his position as being 'in command of the cavalry.'

Satisfaction of Americans in Work.—President Charles W. Eliot, of Harvard College, in *World's Work*, says that any occupation that combines avoidable risks with uncertain productiveness has in it two large elements of interest, and, therefore, of possible satisfaction. Thus, the miner's occupation, in which it is uncertain how much coal or ore a given expenditure of labor in drilling and blasting will produce, has two elements of satisfaction. Every trading operation has in it the interest of adventure. Finally, those occupations which, like the building trades, present from day to day, or from year to year, new materials, processes, designs and products—and, in these days, what occupation does not offer many elements of novelty?—give to the life of the workman the interest of variety, with new things always to learn. The

higher employments in America all offer a large variety from year to year, and even from week to week; but the lower employments, too, offer to ambitious and alert workmen a large variety of mental and bodily occupation. A middle-aged printer lately said to a friend of mine: "I have been thirty-five years in a printing-office, and still I learn something new about printing every day." Indeed, it has been characteristic of the last thirty years that all the main industries have been made over, root and branch.

Students from Other Countries in America.

EVERY quarter of the globe is represented among the students taking the summer courses at Columbia University, of New York, and two of the most interesting men who have just entered are from Asia and Africa, respectively. The Asiatic is Srirangan Desikachar Sheshadry Iyrngar, an East Indian, who has been sent to this country by his government to obtain an electrical education.

The African has been in this country six years and expects to make his home here, his selected life-work being the instruction of others of his race. He was born at Ananaby, on the Gold Coast, twenty-nine years ago, and his family are wealthy, having accumulated a fortune in the ivory trade. His full name is James Euman Kodwo Mensa Ostiwadu Humanpunsam Kwegyir-Aggrey, but for short he answers to James Kwegyir-Aggrey. He will be the first negro to receive the Ph.D. degree from this university.

Iyrngar's patron is Krishnaraj Wadiar, the Maharajah of Mysore, a native state in southern India, containing some of the richest and most productive gold mines in the world. Last year the output of the fourteen mines, which are known as the Kolar group, was more than 500,000 ounces of gold. It is all extracted from the quartz after crushing. The student has already taken his B.A. in physics and chemistry at the Madras University, and he will be able to take the four years' Columbia course in electrical study in two years.

"The mines are leased to English capitalists, who operate them," said Iyrngar. "They pay a rental and a percentage on the output, and the income to my government from rents and royalties is many millions a year. We have a splendid electric plant there to operate all the machinery. It cost \$3,000,000, and was furnished by an American company, which is operating it now. It is to operate it until the government is ready to take charge, and that will be when I have completed my education in this country.

"Ninety-two miles away from the mines we have a waterfall 120 feet high which we call the Cauvery. We have harnessed the water as you have done at Niagara Falls, and we convey the power to the generators at the mines. Formerly it cost \$1,000 a day for coal at the various plants.

"I have been in this country about sixteen months, and most of that time I have spent in the electric company's works at Schenectady. You know when you have charge of a big electric plant you must know everything about every part of it, and I learned my lesson in each of the many departments of the shops. This summer I am taking a course at Columbia in higher mathematics, and in the fall I will begin the electrical course which I shall finish in two years and then return to take charge of the electric plant at the mines which my government will then formally take over."

Successful Maiden Trip of the Big Baltic.

SMOOTH, delightful and successful was the maiden trip of the big ocean steamship *Baltic* to New York last month. The longest, the highest and the heaviest ship ever made had cast her starboard eight-ton anchor off the lightship at 11 P. M. on July 8th.

The *Baltic* is an enlarged *Cedric*, symmetrical in lines, comfortable, if not luxurious, in appointment and steady in a seaway. The biggest of all passenger ships conveys no idea of her gigantic size when seen at a distance. Only by looking up or down her, or by comparison with other objects alongside, does one realize that the *Baltic* is nearly an eighth of a mile long, and that with double skin, holds, decks and platforms she is twelve "stories high." As the revenue cutter churned alongside, it was 64 feet from water-line to sun deck, and no marine ladder mounted on the tender's pilot-house would reach even to the main deck. A companion ladder swung down from the ship afforded the only means of boarding.

The average daily consumption of coal was only 235 tons—striking in comparison with the 700 and 600 ton a day consumption of some of the Atlantic greyhounds. To keep her forty-eight furnaces busy, only 97 hands, divided into three shifts, are employed. There are 14 engineers, 15 oilers, 36 firemen, 26 coal passers, 2 storekeepers, 2 stewards and 1 winchman. The revolutions of the twin propellers were from 78 to 80 a minute.

On every day of the trip the passengers played golf on her open sun deck. The Fourth of July was celebrated with athletic games on the promenades and an entertainment. A full description of the *Baltic* was given in *THE AMERICAN EXPORTER* several months ago.

American Goods for Africa.—Here is a sample of the cargoes that are going away from American ports. The steamship *Swazi* carried these items to Cape Town when she sailed from New York last month: Agricultural machinery, \$39,000; mining machinery, \$75,798; flour, \$17,594; twine, \$19,089; plows and materials, \$11,000; building materials, \$8,700; electrical materials, \$4,500; copper wire, \$5,000; hardware, \$8,600; manufactures of iron, \$17,000; canned meat, \$17,224; other canned goods, \$8,880; petroleum, \$34,725; lumber, \$16,200, and terra cotta, \$16,954.

A. B. FARQUHAR & CO.,

Cotton Exchange Bldg., New York, U. S. A. Cable Address: "Fenankle," N. Y.

MANUFACTURERS OF

Agricultural Implements and Machinery

including **Engines and Boilers**—Vertical, Horizontal, Stationary and Portable; **Threshers**—for Wheat, Oats, Rice, Etc.; **Circular Saw Mills**; **Plows**—Steel and Cast Iron; **Cultivators**—Walking and Riding; **Harrows**; **Grain Drills**—suitable for every Country; Etc., Etc.

THE LARGEST AND BEST EQUIPPED FACTORY IN THE STATES.

THE STEARNS AND FOSTER CO.,

CAPITAL, - - \$1,000,000.00.

MANUFACTURERS OF

Cotton Felt Mattresses,

MADE FROM SPECIALLY SELECTED COTTON.

The cleanliness and purity of cotton for bedding purposes as compared with hair, feathers and other filling material, often found infected, appeal to the intelligence of every householder, and as a result our COTTON FELT MATTRESSES are fast displacing all other kinds. With over 50 years' experience in the manufacture of cotton products, we have special qualifications and facilities for processing cotton for this purpose.

Our mattresses are clean, pure, elastic and soft, and also proof against vermin, germs and dust.

NOT AFFECTED BY CLIMATIC CHANGES.

ESSEX'S STANDARD STEAM-ENGINE LUBRICATORS.

Essex "Pilot" Snap Lever, Sight Feed Glass Oil Cup.

"Simplicity Is the Essence of Durability and Economy."

Such are the ESSEX LUBRICATORS, having few parts (none complicated), made by skilled mechanics, of the best material obtainable; and each lubricator thoroughly tested before leaving our factory.

OUR 1904 CATALOGUE, illustrating and describing the many styles of LUBRICATORS made by us, mailed postpaid to all parts of the world.

We carry a large stock and make Quick Delivery.

Ninety per cent. of automobile makers in the United States of America use exclusively the Essex Automobile Lubricators.

Essex Glass Body Oil Pump.

SIGHT-FEED LUBRICATORS, OIL CUPS, OIL PUMPS, OILING DEVICES, GREASE CUPS.

Note.—With the view of facilitating our increasing EXPORT TRADE, we desire to communicate with one energetic merchant in each trade center of the world.

Prices Quoted F. O. B. New York.

OFFER No. 3.

One car lot (130 bbls.), \$9.00 per barrel, F. O. B., N. Y.

NEW USES FOR AUTOS.

Motor Cars Are Entering Many Fields of Business and Other Usefulness.

WITH the wholesale invasion of auto vehicles, and the consequent rejection of the slower means of transit, the horses are eating their heads off in their stalls, while steam engines and other primitive modes of locomotion rust away in idleness. The day of the long faithful four-footed beast of burden, which has patiently dragged after him every kind of wheeled contrivance made by man, is waning fast with the appearance of auto power. Everywhere one turns in America one sees the horse and old-time vehicles giving way to motor cars. A municipality runs by auto power street cleaners and sprinklers that penetrate the smallest and all trackless streets, a trolley company owns repair wagons so compact as to obviate the usual congestion caused by the original big, clumsy wagons, and store deliveries, a big item in the routine of every-day life, are made in a small fraction of the time formerly consumed.

Then the need of the noisy trolley is done away with in many city streets—much to the relief of the inhabitants of the fashionable quarters—by the auto omnibus, which rolls swiftly and noiselessly through the streets and saves the time and patience of every one. Besides this, by means of this all-conquering power, the difficulties of hauling and making a way through trackless wastes and forests have been overcome by motor vehicles, when even the horses and wagons, going at snail's pace, could scarcely make way, and the use of steam engines was an impossibility.

Even the war-path is invaded by the horseless carriage, which leaves destruction in its wake while escaping from it. This death-dealing carriage recently made its appearance in London in the shape of a round steel shell, spiked on the top with three formidable guns, as a contrivance for road and coast defense in time of either naval or land battle.

Its principal object is to act on the defensive on the coast roads, or with certain modifications for offensive work over smooth or rough roads; for keeping open lines of communication, hauling guns into position or for carrying and hauling stores and men. As it is impervious to bullets of small caliber it may also be effectively employed to dampen the ardor of street rioters or for searchlight operations.

The main object of the car, however, is that of coast defense, and it could, if employed in sufficient numbers, make it impossible for any landing party of the enemy to come ashore, for this war car would soon be able to destroy or sink any invading forces. The great mobility and therefore the great range of action, the fact of its being able to carry sufficient fuel for some 500 miles, the invisibility of the car itself, the absence of noise, as well as its general construction, all add to its great scope and utility.

Amid snow, ice and trackless forests, lumbering and hauling logs are now carried on in America with the greatest ease and speed, for the snow traction auto, the biggest thing in automobiles, has successfully smoothed away all the difficulties attending the work. This huge machine, in successful operation in Gen. Russell Alger's extensive Michigan pineries, plows its way through snow-drifts and over rocks, stumps, everything in the way of obstacles in an uncleared country, leaving behind it a smooth and hard-packed ice road. At the same time it carries an enormously heavy load of lumber and moves at the rate of about twelve miles an hour.

The snow traction auto, however, is not the only machine that can overcome difficulties in transit. Even in paved city streets obstacles apparently insurmountable constantly make their appearance, and are promptly overcome by auto power. The use of horse-drawn emergency wagons by the trolley companies of large cities will soon be entirely dispensed with.

A trolley company in Washington City, the capital of the United States, has installed an electric automobile trolley repair vehicle, which in actual service is daily demonstrating its economy. It was determined to take advantage of the company's facilities for battery charging by procuring a self-propelled repair wagon. Since its installation the vehicle has met every requirement, and when not in use the storage space is small and the cost of maintenance practically nil. The vehicle complete weighs about three and a half tons. A towing device for replacing derailed cars or taking a disabled car to the repair shop is provided.

Of even more importance in keeping a municipality up to the requirements of modern progress is the unique automobile street sweeper and sprinkler that a Frenchman gave to the world. There are the trolley sweepers and sprinklers, to be sure, but this little machine, which has won such universal favor, is far more serviceable—being small, compact, and manipulated equally well in highways and byways. No tracks are needed for the running of this machine, which goes into places that have probably never felt anything but a semi-occasional scrub from the human street-sweeper's broom.

For speed and comfort in the way of street carriages nothing can exceed the American automobile-bus, which first made its appearance in London streets and has rapidly made its way into popularity in other big cities on both sides of the Atlantic. This auto-bus slows up for a passenger, and is off again, all in one-half the time it took the original bus to stop. The remarkable ease and facility with which the huge vehicle is made to thread its way through the crowded traffic of the city streets has been a great card in its favor among pedestrians, and the fact that it is self-controlled and needs no expert drivers has found favor in the eyes of the street railway companies, so the automobile-bus has undoubtedly come to stay.

American Automobile Production Increasing.

ONE of the large automobile manufacturing companies in America is building two additional factories to supply the demand. An officer of the company said recently that the enlargement is due to the increasing demand for automobiles. He estimates that the amount of money expended for automobiles in the United States, based upon the business thus far this year, will exceed \$24,000,000, which sum is about twice the amount of the preceding year.

"We expect," said he, "to manufacture more automobiles this year than any other concern in the world, and we have orders on hand now to keep all our factories busy for several months. At present the demand is chiefly for pleasure vehicles of the best grade, the demand for pleasure vehicles being about five times as large as that for automobiles for practical utility, but it is in the latter direction that the business will grow most rapidly in the future."

"One department store in Boston (U. S. A.) recently ordered twenty-four automobiles for delivery purposes, and similar orders are coming in from all of the large cities in the United States. Improvements are constantly being made in vehicles, both electric and gasoline. For city use the electric automobile seems to be gaining in popularity, but the touring cars are using gasoline. The fact that a large wagon and carriage manufacturer is branching out into the automobile business is an indication that automobiles are supplanting other vehicles. We propose to show the grocers throughout the country that they can deliver their goods cheaper by automobile than by horse trucks and drays, as well as transport their goods more rapidly, and we intend to pay especial attention to their wants in this direction."

Probably the Largest Automobile Ever Built.

WHAT is believed to be the largest automobile ever constructed has been turned out by an American company. The length of the body over all is 26 feet and the width 8 feet. Comfortable seating room is provided for fifty persons, and sixty can be carried without overcrowding. The seats are placed crosswise and have hinged center sections, so that an aisle can be opened, running the full length of the car. The body is mounted upon a steel frame and the electrical and mechanical equipment is similar to that of the largest-sized electric commercial truck, except that the car is geared to a speed of $9\frac{1}{2}$ miles per hour, or about 3 miles per hour faster than truck speed.

The wheel base is 123 inches and the wheel diameter 36 inches. The solid rubber tires are 7 inches in diameter. The battery consists of 44 cells of the oxide type and is sufficient for 30 miles of travel with a full load. There are two motors of 40 amperes, 30 volts each, connected by reduction gears and chains to the individual driven rear wheels. The battery is carried in a single tray, which is raised to its place beneath the body by a simple hydraulic lift and secured by automatic locks. By this device the batteries can be changed in a few minutes. The vehicle is covered by a wood roof supported by iron rods, the sides being left open.

Future Market for American Vehicles.

THE possibility of developing a valuable export trade in vehicles with the west coast of South America, or at least in vehicle material, has for a long time attracted the attention of some enterprising exporters. If the Chilean Government carries out its present program there will be some opportunities for an early growth of business in that direction. That Government expects to expend some \$100,000,000 gold on public works within the next fifteen years. Contracts amounting to over \$30,000,000, it is reported, will be initiated during this season, including the Trans-Atlantic Railway—contracts for construction of sections of which have been allotted to W. R. Grace & Co. and S. Pearson & Son, Limited—the sewerage and paving of Santiago, the harbor improvements at Valparaiso, etc., and several hundred miles of railroad. Tenders for cars, locomotives, etc., will soon be called for, which will result in the expenditure of some \$250,000.

Increase in Wire, Wire Nails and Pipe Exports.

RETURNS of the exports of wire, wire nails and pipe for June, which have just been received, show a total of 10,000 tons, being a gain of 2,000 tons over the preceding month. The exports of wire amounted to 3,932 tons. The chief consignments went to South America, Australia and Europe. The exports of pipe amounted to 4,641 tons. Europe received 3,601 tons, 2,835 tons of which went to the Continent. Antwerp headed the list, that Belgian port taking 1,433 tons in three lots. One thousand four hundred and sixty-five tons of wire nails were consigned abroad during the month. Great Britain and Australia were the largest purchasers. Four hundred and sixty-six tons went to British ports, Liverpool taking the bulk, while Glasgow, London, Manchester and Bristol took the balance between them. Two hundred and fourteen tons went to Chinese and Japanese points. Australia was sent 399 tons in three lots. Chili was forwarded one lot of 128 tons. Constantinople was sent 142 tons in one shipment. Other exports of wire nails last month went to Mexico, Malta and South Africa.

A Sharp Demand for Machinery.—The machinery manufacturers in America received last month inquiries for a large amount of machinery which is needed in the development of new manufacturing enterprises.

EMBOSSED METAL CEILING, Side Walls and Center Placas. LARGE AND COMPLETE LINE OF CLASSIFIED DESIGN.

New Catalogue sent on request to those interested.

CANTON, OHIO, U.S.A.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices. Our watch factory is the largest in the world devoted solely to manufacture of time-pieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES
Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

F. O. B. New York.

Catalogues and full information, also special discount for quantities, may be obtained through your commission house or direct from us.

One gross of watches packed for export weighs about 50 lbs. and measures 14 cu. ft. Send all orders through your commission house and send us copy of same.

Coin- Operating Machines.

Our 80-page catalogue, just issued, profusely illustrated, in colors, describing the many styles of Coin-Operating Machines made by us, will be mailed post-paid to all parts of the world.

Nearly all our Coin-Operating Machines can be made to be operated by the coin of any realm.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify MILLS NOVELTY CO.'S COIN-OPERATING MACHINES, and to avoid errors, please mail us duplicate of order.

Worth and Uses of Our Traction Engines.

ONE of the prize-winners in the recent competition held by the *American Thresherman* wrote an essay regarding the full earning power of American traction engines. Most of our foreign readers are already aware of the superior advantages of our machines, but the following will interest them, nevertheless.

"The term traction engine implies a steam engine that is capable of self-locomotion—that is, able to move by its own energy. In other words, it has potential energy capable of doing work. Since the engine is capable of performing much work, if all its energy is utilized, it is important to determine what is the full earning power of the traction engine. In order to do this intelligently it is necessary to limit the subject to only such conditions as are found on the average farm in North Dakota (U. S. A.). The owner and operator of a traction engine is generally a farmer, and it is to his benefit that the following discussion of the full earning power of the traction engine is offered.

"The topic may well be divided into three heads for convenience of discussion—namely: Regular or customary work, occasional or locomotive work, and lastly, utility or stationary work. Each one of these topics will be considered individually in a logical order. The regular or customary work of the traction engine is to furnish the necessary power to separate the golden grain from the baser products—straw, chaff, weeds, etc. It works in conjunction with the grain separator—it furnishes the energy and the separator does the actual work. Besides doing this work the engine is capable of moving, not only itself and the separator, but also the equipment that belongs to a threshing outfit. While so doing all its energy is utilized, and a full earning power of the engine is the result.

"The period of this active service of the traction engine, however, is only of short duration—thirty to forty days at most; all the rest of the year in the United States the engine has no regular work to do, and is therefore generally idle, until the earth has made another revolution around the sun. Such a condition of affairs necessitates much loss to the owner, as the engine produces value only when it is working. It is with this in view that the second topic will be taken up for discussion.

"Occasional or Locomotive Work.—Experiments have proved that a traction engine for plowing is of economic value, since it can pull four ordinary gang plows with ease. In a stony country, however, it is not advisable to use an engine for this purpose, because it will tear the plow to pieces, but where no stones are present it gives great satisfaction, especially in the fall, when the ground is sufficiently dry. For pulling a road-grader the traction engine gives good satisfaction, as it can be operated with ease, and its speed and strength modulated, thus insuring the best work. In stony localities it may be used for pulling out the heaviest rocks, etc. It is not advisable to supplant horse-power by steam unless great strength is required, as the cost of running an engine is greater than the keeping of two or four horses.

"Utility or Stationary Work.—During the winter months the traction engine may be made to do much profitable work at very little expense. To derive the most profit from the engine, it should be placed in a substantial house large enough to permit of a work-shop, a feed-mill, etc. The engine-house may serve as a blacksmith-shop, wood-shop and storeroom for many farm implements. Thus the cost of a special engine-house is unnecessary. The engine may be made to run the feed-mill (which should be in the same building). Besides grinding his own feed the thresherman can make a nice little sum by grinding feed for his neighbors during the dull times. By proper arrangement the engine can be made to pump the water and force it into the barn, thus reducing work and expense. Since North Dakota is destined to become a corn State, a corn-shredder may well be put in and operated by power of the traction engine. A wood-saw may also be put in with very little expense. By skill and ingenuity two or more of these machines may be kept running at the same time, thus saving time and money. It is not expedient for a farmer to have too elaborate a machine shop, as it then will divert his attention from agricultural pursuits. The equipment mentioned, however, is both necessary and economical, and should therefore form a part of every farmer's stock of farm implements.

"Steam heat is acknowledged to be the best and most uniform. It is easily regulated and is free from all danger of fire. At a moderate expense every owner of a traction engine may have steam heat in his house. The economy of this arrangement is twofold. First, it saves the expense of a furnace or any other heating apparatus; second, steam heat may be furnished much cheaper than the ordinary stove heat.

"From an economic standpoint, steam heat is far superior to any other method of heating on the farm. Since the traction engine is a straw-burner the cost of fuel is reduced to a minimum. Flax straw, especially, is very efficient as fuel, since it burns slowly and gives off much heat. Experiments have shown that a flax-straw fire will burn almost as long as a wood fire. It is, therefore, self-evident that the steam heat as produced from the traction engine is of economic value. If the flax straw was pressed it would be easier to handle. If convenient a hay-press should form part of the equipment of the machine-house.

"For convenience and economy as well the power-house should be as close to the house as permissible if steam is used for heating purposes. A little greenhouse may be put up in connection with the engine-house, thus increasing the horticultural interest on the farm. A traction engine housed and cared

for in this manner will last much longer than if left out of doors to the destructive forces of the elements.

"The ideas set forth in this essay are intended as suggestions and not as arbitrary rules. No attempt has been made to describe the construction of the engine-house or machine-shop, neither has any attempt been made to give a technical description of the arrangement of the pulleys, etc., necessary to operate each machine. The construction and arrangement of these must be left to the skill and ingenuity of the individual who owns and operates the traction engine."

Our Agricultural Implements Abroad.

WE referred in our last issue to the progress which was made in last year's American export trade in agricultural implements. The editor of *Farm Machinery* has written a very interesting article on the subject, which is worth reproducing in full:

"There is real romance in the bold statement that this country sent \$21,000,000 worth of agricultural machinery abroad in the year ending last June, or nearly \$5,000,000 more than in the preceding year. The romance is twofold—of a country paying the highest wages in the world, yet meeting with its harvesting machines and farming tools the competition of goods made by low-priced labor, defeating them in the neutral markets and then successfully invading the very markets in which they are at home, and of whole continental areas, inert under ages of tradition-bound cultivation, responding at last to the touch of new-world resourcefulness.

"In all parts of the world American agricultural machinery is standard; everywhere it is welcome. The Canadians are imitating it, and they are spirited rivals. The Germans are imitating it and selling their harvesters beyond their own boundaries; but even in Germany, on the vast estates of Posen, Silesia and East Prussia, the demand grows for American machines. In Russia agricultural machines are the best line of American business. De Witte exempted them when he began the tariff war with the United States, because he felt they were needed in his chosen task of internal development. They are admitted duty free in Newfoundland and Syria. Poland, resentful of Germany's anti-Polish propaganda, has turned from German to American harvesters.

"Our people pushing these machines in foreign markets for their own gain—that is one side of the picture. The other is the transformation by American ingenuity of traditional methods of agriculture, of conditions of rural existence that have not changed a great deal in 2,000 years. Our labor-saving farm machinery is conquering the peasant conservatism of Europe and Asia, as the reports of our consuls attest. Among other things they tell us that in the interior of Spain the peasant is using the same plow he used in the time of Pompey; in southern Greece the same plow he used in the time of Pericles; in Syria the same plow he used in the time of the Herods. In all British Honduras there are said to be not two dozen plows; machetes do their work.

"American agricultural machinery is bringing these regions up to date. It is striking its bargain with antiquity. Our harvesters are pulled by mules in Argentina, by bullocks in Italy, by camels in Central Asia, sometimes by elephants in India.

"There is still another service they are performing. Everywhere throughout the world there is a drift of farm laborers to the cities; wages are higher there, conditions of life more seductive. American labor-saving machines, and machines made after American models, are preventing large tracts of land from going out of cultivation. In Austria, in Great Britain, they are doing the work which the peasants abandoned when they laid down their hoes and took ships for America. Curiously enough, in some countries, as in Italy, they are causing a return wave of farm labor from the cities; they are making it worth while to reclaim land from pasture to tillage.

"Some time, maybe, the Odyssey of the American harvester and threshing-machine in other lands may be written; in its way it is a larger epic than the national epic of the wheat."

New Clock Dial Displaces the Hands.

A CONNECTICUT (U. S. A.) man has invented and patented a clock which does away with the hands and dial of the clock now in common use. Instead it has three openings in the face of the clock, behind which appear numbers, so that the time is read direct, as 12—45—32, instead of a series of hands pointing out the hour, as 45 minutes and 32 seconds past 12. The system is an improvement on the clocks of to-day, according to the inventor, because there can never be any confusion between the hands, and the time is tellable as far as the figures on the dial can be read, while with the clocks of to-day the face can be seen long after the relative position of the hands has become indistinct. The clocks are to be manufactured and put on the market in the near future.—*American Inventor*. [When this clock is put upon the market our readers will be informed of the fact.]

New Device to Split Wood.—A wood-splitting machine is a recent invention of novelty and interest. It consists of a very heavy knife, which is worked backward and forward at a speed of sixty strokes per minute. The device is run by a gasoline motor of a few horse-power and can successfully split logs of wood, no matter how knotty, 2 feet long and 18 inches thick.—*American Inventor*.

TRADE MARK

A detailed black and white illustration of a large roll of paper. The roll is partially unspooled, showing a repeating diamond-shaped pattern. Each diamond contains the text 'TRADE MARK', 'SMOOTH-ON', and 'MADE IN U.S.A.'. The paper has a textured, slightly wavy appearance. The roll is shown from a perspective that emphasizes its length and the pattern's repetition.

SMOOTH-ON MFG. CO.,
VREELAND TOMPKINS, - Chemist and Manager,
JERSEY CITY, N. J., U. S. A.

Our illustrated catalogue, printed in colors, showing the various styles of Game Boards made by us, mailed postpaid. We will also forward, postpaid, our catalogue, illustrating and describing our many styles of **COMBINATION LIBRARY, DINING, BILLIARD and POOL TABLES**. Orders received direct or through export houses. When ordering through the latter, to prevent errors, please mail us a duplicate of order.

Visitors to the World's Exposition are cordially invited to visit our **WORKS at LUDINGTON, MICHIGAN, U. S. A.**

York Manufacturing Co.,
York, Pa.

A SWELL FRONT desk of exceptional value to every desk user. Card index drawer with follow block attachment; private compartment with flat keyed spring lock; letter file complete; 11 pigeon-hole boxes, 9 inches deep. Special arrangement for stationery, memorandum books, etc. File boxes and card index drawer, trimmed with cast-brass holders and highly polished cast-brass knob pulls; all parts highly polished.

Special attention given to filling Export Orders. Send for Illustrated Catalogue and Export Price List. Order through buying and shipping agents, and send us duplicate of orders, so as to avoid mistakes.

Record Year in Foreign Commerce.

IN the record of the year's commerce just announced by the American Department of Commerce and Labor is presented an interesting and gratifying view of the commercial status of the United States. The fiscal year 1904, it would appear, has proved to be the banner year, the foreign commerce of the United States reaching the highest aggregate in its history. The exports of manufactures are larger than in any preceding year and the exports of domestic products exceed those of any other country.

Comparing the figures of 1904 with those of earlier years, it may be said that the total exports are larger than in any preceding year except 1901, that the imports and exports are greater than in any preceding year except 1903, and that the total commerce—the imports and exports combined—in 1904 is greater than that of any preceding year. The total commerce of the year amounts to \$2,451,574,623, against \$2,445,860,916 in 1903, and \$2,310,937,156 in 1901, the years in which imports and exports, respectively, made higher records than those of 1904. Thus, while neither imports nor exports for 1904 reach the high record of a single earlier year the total of imports and exports combined in 1904 exceeds the total commerce of any earlier year.

In manufactures the exports of the year will make their highest record. While the figures of manufactures exported for the full fiscal year 1904 have not yet been completed by the Bureau of Statistics, the fact that the eleven months' figures already completed exceed by \$17,000,000 those of the corresponding period of the record year, 1900, makes it apparent that the total exports of manufactures in 1904 will be greater than those of any preceding year. It is also apparent that the exports of domestic products from the United States will exceed those of any other country.

An interesting feature of the report is the comparison it affords between the commercial progress of Great Britain and the United States. The vicissitudes in the race for commercial supremacy between the two countries reminds one forcibly of the alternations of success and failure in the contests between two great rival colleges in the field of athletics. Next to the United States Great Britain is the world's largest exporter of domestic products, and up to a few years ago surpassed the United States in its total. During recent years the United States, although there have been many fluctuations, has gained steadily and rapidly upon and finally overtaken Great Britain in the commercial contest.

The first year in which the exports of domestic products from the United States exceeded those from Great Britain was 1898, the excess in our favor in that year being about \$98,000,000. In 1899 the pendulum swung the other way, the exports from Great Britain exceeding those from the United States by about \$35,000,000. In 1900 those from the United States exceeded those from Great Britain by about \$35,000,000. In the year ending June 30, 1902, those of the United States exceeded those of Great Britain by about \$8,000,000. In the fiscal year 1903 Great Britain was again at front, her total of domestic exports exceeding that of the United States by \$22,000,000. In the fiscal year 1904 the United States will apparently be again in the lead, since figures of eleven months already in hand show for that period an excess of \$38,000,000 in favor of the United States.

While this steady growth in our foreign trade may be accounted for in a variety of ways there can be no question that one of the chief causes of our success is the fact that our manufacturers and exporters have succeeded in demonstrating abroad that the products of the United States can be relied on to be what they are sold for. In other words, that our foreign trade is conducted along the lines of strict commercial integrity.

German Statesman on International Trade's Future.

UNITED STATES CONSUL GUENTHER, at Frankfort, in a recent report to the Department of Commerce, refers to the present Minister of Commerce of Prussia, Mr. Moeller, as a leading manufacturer whose "administration of the office, his activity and speeches show the manufacturer and practical business man." Recently Mr. Moeller was on an inspecting tour in the Silesian manufacturing district, and at a reception given him by one of the Chambers of Commerce there he made the following noteworthy remarks:

"Germany's greatness has been brought about by her industrious and laboring forces, especially by her business people; in her capacity for work lies Germany's superiority over other nations. Therefore, we should be very careful not to stifle or limit opportunities for labor. We Germans can look with confidence toward the future, yet we must beware of entertaining false notions. During the next decade it will not be the individual but the nation which will have to struggle for existence in commerce and manufacturing. There are always more nations appearing in the world's market as new competitors, whereas the consuming capacity of that market does not increase. If the present existing spirit among nations to close their borders against imports attains further growth, we Germans may have to suffer.

"In the development of our industries we have not, as England has done, confined ourselves to certain specialties; on the contrary, we have cultivated all varieties of manufacturing. England's prosperity has already waned because new industrial nations themselves produce the specialties with which England supplied them. These are usually articles manufactured in immense quantities. Herein lies England's danger.

"As to work in a contrary direction, it behooves us to promote trade schools in order to stimulate the production of the finest and highest class

articles of manufacture, thereby affording employment to a greater number of persons. Our future depends upon the production of such articles which will be sold in foreign markets, as these enable us to maintain our labor force. We must either export our goods or our working people."

The time is not far off when articles for general consumption (textiles, metallic wires, etc.) will be mainly exported by those countries having natural advantages in manufacturing the same or producing the raw materials thereof. Thus England and other industrial countries of Europe will have to surrender the world's market to favored nations like the United States. It is only in articles requiring great artistic taste and superior skill of handicraft that the European nations will be able to compete successfully. As such, France is now predominant, and Mr. Moeller's admonition to the German manufacturing class seems to mean in effect, "Follow on French lines of manufacturing for export trade."

A View of America's Popularity Abroad.

BRITISH and other foreign sentiment regarding America is treated of in an interesting manner by a writer in *Harper's Weekly*. In the course of a long article he makes these observations: "As a matter of fact no English politician ever thinks of mentioning the United States in a speech without some complimentary adjective, and the British public, which has long ceased to be the most stolid public in Europe and become instead, thanks to cheap reading, one of the most hysterical and sentimental, always cheers heartily any allusion to 'our cousins beyond the sea' and agrees rapturously with the speaker that 'blood is thicker than water.'

"An American who tries to persuade himself that his country has a political foe in England had better stay in America if he wants to keep his faith whole. It would hardly survive a fortnight in England itself. Englishmen bear no grudges. They are proud of Washington as Americans themselves—most of them are not even aware that there was such a thing as a war of 1812—while they quite cheerfully admit that all through the Civil War and the Alabama business they were in the wrong and were rightly made to pay for it. In the visitors' room at the Reform Club on Pall Mall you will find over the mantelpiece a facsimile of the Declaration of Independence and above it medallions of Washington, Lincoln and Grant. There is something rather fine in a people that can thus candidly publish and acknowledge two of the greatest blunders in their history. But the English have grown into a big habit of always exempting Americans from the ordinary divisions of nationality. Cecil Rhodes was far from being the only Englishman whose patriotism went beyond the empire and included the race. The least imaginative Londoner feels himself and his country in a very special degree united to America. It is the nation of all others he would most like his own to be on friendly and even intimate terms with."

American Railway Material for Hayti.

EARLY last month the Hamburg-American (West India) Line steamship *Alene* sailed for Port-au-Prince, Hayti, having on board a record cargo of railway material, the freight assessment upon which alone amounted to more than \$1,000. The consignment, which included rails, switching and signal apparatus and rolling stock, was for the Chemin de Fer du Nord, a railway being constructed by the Haytian Government, from Cape Haytien on the north coast of the island to Hinche, some thirty miles inland. When completed it will traverse the rich Ste. Suzanne district, which abounds in mines of copper and other ore and varied timber lands, as well as cocoa, tobacco and a large acreage of cultivated cotton. It is intended ultimately to extend the road southward for some 200 miles to connect at Thomazeau with the Port-au-Prince Railway, which is now operated by German capital, but which, it is said, the Government purposes soon to take over under the original concession.

A Hint for American Exporters.—It has been suggested by George H. Jackson, United States Consul at La Rochelle, France, that the existence of a direct service between Montreal and that city affords an opportunity to importers and dealers in that part of France to obtain merchandise directly from America instead of having them sent by way of Havre or Bordeaux, or even Marseilles, as at present, necessitating a long railway haul and heavy freight charges. Mr. Jackson believes that if American goods were sold at the lower rates which direct transportation would make possible, such products as fresh fruits, canned fruits, meats, etc., would become very popular. "York" hams, packed in Chicago and Cincinnati, are now retailed in La Rochelle at 32 cents per pound and American leaf lard at 16 cents. Such prices limit the market and are due chiefly to freight charges and commissions to middlemen. The subject is worthy the attention of American exporters in all lines of trade.

Agricultural Implements in Mexico.—United States Vice and Deputy Consul-General Conley, at Mexico City, Mexico, reports as follows: "About 20 per cent. of the agricultural implements and tools used in Mexico are modern; the other 80 per cent. are of the crudest and most primitive type. Only the large farmers, or haciendados, employ modern agricultural implements, and those only within comparatively recent years. Labor in Mexico is very cheap. About 95 per cent. of all modern agricultural implements and tools used in Mexico are imported from the United States."

"IDEAL" Steam Cookers

FREE Book of 36 pages, printed in colors; handsomely illustrated; tells all there is to know about steam cookers—round or square. The 1904 models of "Ideal" Steam Cookers are entirely new in principle, design and special features. The only steam cookers made in which both round and square have whistles to call the cook when water is needed. Seamless copper tank bottoms.

Cooks a whole meal over one burner, on gasoline, oil, gas or common cook stove. Reduces fuel bills one-half. Agents wanted.

We Want Foreign Agents, and to get them quickly, we are making the following liberal proposition for this month:

No. 20, Sq., Copper Tank
Retail \$6.50 Each.
13-gallon food capacity. 12 Cookers in a box. Measurements and weights of boxes holding 12:

Gross weight, 210 lbs.
Net weight, 144 lbs.
Cubic feet in 12—28.
\$39 doz., f. o. b. N. Y.

No. 6 Round Cooker
Retail \$5.00
10-gallon capacity. 12 Cookers in a box, nested, solid. Measurements and weights, 12 in a box:

Gross weight, 150 lbs.
Net weight, 120 lbs.
Cubic feet in 12—11 1/2.
\$33 doz., f. o. b. N. Y.

These are our best sellers, but we make thirty different sizes of Cookers. Boxed ready for steamer. Order direct or through export house; in latter case, mail duplicate order to us to avoid errors.

We manufacture a full line of Kitchen Specialties and Blue-Flame Wickless Oil Stoves.

LIGHTING OF BIG STORES.

Satisfactory Results Follow Adoption of Scientific Prism System by American Merchants.

IN their desire to make their stores as attractive as possible to their customers American merchants are ever in search of new ideas, and the matter of expense is a secondary one when it is a question of obtaining an improvement in service. With emporiums many stories in height and often extending a full city block in depth the question of a proper lighting system is of the first importance, and much attention is being given in New York and other great commercial centers to this problem of artificial lighting.

The *Dry Goods Economist* during the last year printed several articles on this subject, and in a recent issue the question of correct and incorrect prism systems was taken up and treated from a practical standpoint, due emphasis being laid on the fact that there is a great difference not only in prism glass, but also in the methods of installing it. No really good thing, it is pointed out, having a commercial value, is even without its imitations or its counterfeits, and the present demand for the prism service, which may be traced to the merits of a high-class product, has led to the introduction of prisms of a much inferior character.

An instance is cited where a firm desired to lease a store in one of the most prominent business centers in New York. One of the conditions of the lease was that the transoms over the show-windows were to be equipped with prism glass. No particular make or system of prisms was specified, and a kind of prism glass was put in. The occupants now wish they had known more about prism lighting, for while their windows contain prisms, their store actually has less light than if the glass were in plain plate.

In the same locality is a fine new mercantile building, completed within a year. Contrary to expert advice the transoms over the windows of the first floor were glazed with prisms of an inferior make. These did not prove satisfactory to the lessees and a better grade was substituted. Only the architect knows why the best prisms were not provided in either the first or second instance; the best could be had with its high-class service at a nominal advance in price.

When it is considered how many factors there are that have a bearing upon the choice of a prism equipment and its method of installation, it will be seen how important it is that only prisms which are scientifically selected and scientifically used should ever have a place in a modern store building. It is just here that the services of the lighting engineer—the expert—is found valuable. The limited knowledge of the merchant, the architect or the builder is seldom equal to the occasion.

As an illustration the case of a store building, consisting of three floors and a basement, is considered. It is flanked by a tall structure across the street at the front, with another building across a narrow alley at the rear. The sky angle is quite limited in all cases except at the sidewalk. Through the sidewalk prisms at the front and the prism skylight at the rear the basement area is made as light as any floor above would be without the prisms.

Without the prisms on the first floor, front, all the direct rays would be wholly or partially absorbed at the top of the show-window. With the prism transom the light is deflected and diffused into the interior of the store so that the area midway is even brighter than would be the spot directly back of the enclosed window without the prisms.

The rear of this floor (and also the floor above) would be poorly lighted were it not for the prism canopy over the rear entrance. A transom equipment would be of but little service here, as it could be reached but by very few direct rays. As it is, a very satisfactory service is provided.

The moral is drawn in conclusion that prisms of one, two, or even six angles are not equal to the demands of a first-class illumination, and that it is only through the advice of the illuminating engineer that the best service is possible.

Features of a New Store in New York.

OUR readers abroad are perhaps not much interested in domestic trade methods in America, but the recent opening of a great department store was a prominent feature of New York's experiences, while the methods of the concern embrace some things that are new in institutions of this kind. No name is used, the store being merely called the "14th Street Store," which is used in gold letters wherever a name is needed. The store is six stories in height and covers a large area.

Special attention has been paid to the comfort and safety of shoppers. There are lavatories on every floor, while of twenty-one passenger elevators nineteen are intended for customers' use, the remainder being designed for employees. There are four freight elevators, so that in case of fire twenty-five elevators, as well as seven stairways, are available. The precautions taken against fire are worthy of note. Not only is the construction of the building as nearly fireproof as possible, but automatic sprinklers are installed on every floor. On the sounding of an alarm, fireproof doors completely shut off the elevator shafts from the rest of the building. In case of fire during business hours, however, employees designated for the purpose will give admittance to the elevators. Furthermore, any floor may be immediately isolated, with a view to confining the fire thereto.

Upon entering the employ of the house clerks are instructed not only with regard to making out the checks, salesslips, etc., but also as to their action in case of fire. Fire drill is of frequent occurrence. All of the refuse matter, including packing, broken boxes, sweepings, etc., is disposed of in a

crematory in the basement, reached by a chute extending to the roof, with an opening on every floor. By a patent device such waste may be thrown into the chute at any time, and, though the fire may be raging hotly, so perfect is the system that the employee who throws in the stuff will not be cognizant of any heat.

The wrapping system is a departure from anything practiced elsewhere in New York. On the main floor and at busy departments in other locations there are a cashier, a wrapper and an inspector at every counter, thus obviating the sending away of goods to be wrapped and money to be changed and the delays incident thereto. In other sections of the store the pneumatic tube system is employed.

A special chute leading to the shipping room in the basement transports goods quickly and with perfect safety. On the fourth floor is a ladies' parlor and retiring room, the color scheme in green and the walls, furniture and carpet all conforming thereto.

On the roof is a children's playground, with fountain, sand heap and miniature lake. Here mothers may check their children and leave them in the care of competent attendants. The little ones are made happy with pail and shovel, outdoors if the weather permits; indoors, if not. Should they become sleepy they are put to bed and are given all necessary attention.

The restaurant on the sixth floor is a bright, cheery room, capable of seating from 400 to 500 people at a time.

In its desire to give every comfort to customers the management has not overlooked its 3,000 employees, who are furnished with a cheery recreation room on the seventh floor. A temporary hospital in charge of a trained nurse and supplied with remedies and appliances is also provided. There is a special restaurant for employees, where at noon they can procure chowder and soups for 5 cents and coffee for 3 cents, as supplementary to the lunches brought from home. Supper is furnished free to those obliged to stay for evening work, checks therefor being given the employees by the buyer or department head.

We have not space to go into details, but it may be added that in this store everything that one wants to eat or wear can be purchased and that every known convenience for customers and employees is provided.

Modern Scarecrow with Electric Attachments.

HERE is a story that is interesting, but we do not vouch for it otherwise: "Saw a new kind of scarecrow up the State not long ago," said the

New York drummer back from a trip. "Enterprising farmer up there near enough to town to have electric light in his house was troubled with the birds in his small fruit, and no scarecrow he could devise was any good. Had a foxy boy about 14, with a freckled face and a red head, who wanted to go swimming overtime, and he set the youngster to keep off the birds. Boy didn't like it, but the old man forgot all about when he was a boy, and kept the youngster at the truck patch.

"Third day was all the boy could stand, and he began to spar for a substitute scarecrow. Had one of those disk phonographs that was capable of a continuous performance, and he got it out and began performing with it. He finally yelled all sorts of wild cries into it, rigged a megaphone to the horn about seven feet long, connected it with the electric wire, started it going and went off with the gang to the swimming hole.

"Old man had been in town, and as he came home about 4 P. M. he heard a racket out back of the house that sounded like a cross between a political meeting and a riot. Saw the chickens sprinting across the fields squawking and noticed the birds in the air turning tail and skimming for the woods. Didn't know what had happened and licked up his horse till he looked like a Derby winner in the homestretch. Bounced out of the buckboard at the front gate and made for the garden. Nobody in sight, but row was going on that was making the berries fall off. Found the phonograph, but he didn't find the boy. Then he sat down and laughed and laughed and slapped his leg till it was sore.

"When the boy came back to supper with his shirt on wrong-side out, of course, the old man took him to the woodshed, and, with tears of joy in his eyes, told him that if he wanted to go to college and become an electrical engineer he'd pay the bills. The phonograph was still busy when I left, and the boy was crowding in all the swimming he could during the summer, because he was going to college and be a man in the fall. Did you ever hear anything like that before?"

Europeans Like Our Shoe and Leather Machinery.—Exports of American shoe machinery for the ten months ending April 30th (the latest exact figures available) were \$845,804, as compared with \$599,731 for the corresponding ten months of the year previous. This gain has been caused chiefly by the installation into European shoe factories of improved American machinery for the purpose of successfully competing with shoe producers in the United States for export trade. There is also an increasing demand from abroad for American leather machinery. One American concern recently filled a large order for leather machinery, comprising a full equipment of shaving, splitting, necking, staking, glazing and belt knife and measuring machines for a tannery in the Hawaiian Islands. Tanneries are also being fitted with American machinery in the Argentine Republic, Australia and many other countries.

American Railway for Burmah.—The Municipal Council at Rangoon, Burmah, has decided upon the awarding of a franchise for the construction and operation of an electric lighting and traction system to a local engineering concern, and it is reported, in advices just received from the Far East, that a good portion of the equipment will be of American manufacture.

Olds Gas and Gasoline Engines

Each engine is fully tested, before it leaves our factory, to its full indicated horsepower. Its simplicity of construction and perfection of mechanical principles have been amply demonstrated during the past 23 years. Olds engines are standard the world over.

Stationary Engines, - 2 to 100 H.-P.

Portable Engines, - 8 to 18 H.-P.

We will send full information and new illustrated catalogue upon request.

OLDS GASOLINE ENGINE WORKS, 209 River St., Lansing, Mich.

Americanization of British Manufactures.

UNITED STATES CONSUL HALSTEAD, at Birmingham, England, sends a long report upon the above subject to the American Government, which is chiefly interesting to our foreign readers as showing British appreciation of the worth of the mechanics who make our goods for the export trade. A few extracts follow:

"My interest in tube manufacture was aroused originally by the fact that weldless or seamless cold-drawn tubes, made with exceeding care to meet certain high-grade requirements, were, and still are, shipped to the United States from my consular district. This interest increased when I learned of the engagement and importation by one great British tube company with works near Birmingham of four American workmen, to go on night and day shifts of two each, to take charge of a lap (tube) welding plant built on the 'American plan.' Besides, when I was in the United States last June I read in the newspapers that this American competition with America had been followed—the newspapers announced that the men were starting for England—by the engagement of four American butt-welders for work with another British tube company in a town near Birmingham, also in my consular district, and, strangely, this missionary trip of American workmen seemed to be regarded as a matter for congratulation upon our part.

"There has been constant progress in the manufacture of lap and butt welded tubes, increase of speed in making them and very great advancement toward perfection in results, and that these improvements have been largely American is made evident by the fact that new butt and lap welding plants in Great Britain are built on American lines.

"The workmen were brought here from Pittsburg (U. S. A.) and adjoining tubemaking neighborhoods, the lap-welders under five and three year contracts, the butt-welders under three and one year contracts, at wages many times greater than the ordinary rate of wages in this district, and, as an inducement to the men to come here, at an advance—not a big one—over American lap and butt welding wages. Of course, the inherent spirit of adventure and the idea so generally held in America, and as generally erroneous, that living is much cheaper in England than in America, influenced these men to come here. There were some disappointments in store for them, but they are fairly happy and content now, though without doubt they are the only workmen in this neighborhood who pay a good big income tax, and, of course, an income tax was not in their calculation as an offset to their earnings here. They have told me that they cannot live as cheaply here as they could at home; certainly, food is dearer; and clothing, even, all articles of wearing apparel for a family considered, they think not as cheap as at home. I really should print some letters I have had from them on the subject.

"Near one of the works the men were not able to find at any price houses with the conveniences they were accustomed to and had thought necessary to their comfort when at home, because there had not been anticipation that men in their position would have an ambition to or could afford to occupy the kind of houses they had thought they required, and they could not go into a better neighborhood—that is, the middle-class neighborhood they could afford to live in—because, working before hot furnaces they must get indoors, for a time at least, as soon as possible after they had finished their work. The company very kindly complied with one of their requirements—something unusual here—by providing them with a convenient place at the works for changes of clothing.

"In the case of one of the plants for lap-welding, while it was supposed to have been built on American lines, the furnaces were not satisfactory, the brick linings being a few inches instead of many inches thick (my consulate records show that Staffordshire firebrick was formerly shipped to the United States) and the sand for the bottom of the furnace was not satisfactory because, taken from the mouth of a river, it contained dirt, while there was need for a pure sand, and the plant was too close to other machinery.

"Most of these difficulties have been adjusted to their liking. They secured at last a pure sand, and a better brick is used, so that the furnaces are not down as often as originally and they can now make their bonus for output regularly, and I think I am correct in saying they have tripled any English coal furnace output with one furnace and same number of men—though it is not as great as they might wish, for recently they have produced more than the company can sell, and they have long lay-offs. The butt-welders in the other works found in the new machinery that the American plan had been reversed, so that tubes started fast and then went slower, and therefore did not clear, so by an arrangement with the management, the company's draftsman having been placed at their disposal, they have had to rebuild the plant so that the butt welding can start slow and finish fast."

Island Stepping Stones for Our Pacific Commerce.

SCATTERED in the Pacific Ocean, from Alaska to Siberia, there are about 150 islands that belong to the United States. They are called the Aleutian Islands, and have always been thought to be good for nothing. But recently Captain McClellan, of the American revenue cutter Manning, returned from a long voyage through the Aleutian Islands, and he reports that the map-makers of the world have made a great mistake.

All through these islands; he says, there are safe harbors. Half a dozen fleets could steam into some of these harbors at once without crowding. The dangerous rocks that were on the maps do not exist. These harbors are open all the year round. A steamship can start from Puget Sound for China,

and for 4,000 miles it can cast anchor every night in an American harbor. Naval experts say that this is the most important discovery for 100 years.

These islands are not much farther north than Japan. The climate is mild, because a warm Gulf stream flows up from the southern ocean around the Aleutian Islands. A town called Jarvis has already been founded on one of the largest islands, and a colonizing company will start other settlements at once.

"Our beef cattle will in the future come from the Aleutian Islands," says Professor Kincaid, who spent some time exploring them. There are cod and seal fisheries of the greatest value. Copper, gold, coal and iron have been found. Water power is abundant. The United States bought these islands thirty-seven years ago from Russia, but did not know their value until a few weeks ago. Now we know that they form a great island bridge from Seattle almost to Japan, and in a few years will be colonized by American citizens. "They are of incalculable future value," says Captain McClellan.

Onward March of the Shoe Industry.

IN the shoe and leather industry Americans have gone ahead in the matter of getting machinery to do all that can be done. The efficiency of the leather-maker helps the shoe manufacturer in his fight for the world's market, as nearly two-thirds of the value of his product is the cost for materials alone. The introduction of machines that not only reduce the amount of labor but frequently replace skilled labor with unskilled, and the quickness of employers to adopt new processes account for our success.

A visitor to a modern American tannery would see a man here and there dumping a hide upon a moving feed-table that smoothes and straightens it out and then passes it through a machine, pressing it evenly and gently against a revolving cylinder, spiraled with knife-blades, and drops it out at last clean and without a cut or tear. He would see "putting-out" machines that pressed and scraped tanned hides at the rate of 350 dozen per day, attended by only one man; or splitting-machines, where a belt of thin steel, sharpening itself by touching an emery-wheel as it whirled, could split a hide with the deftness of magic into sheets as thin as tissue-paper—a machine that can be adjusted to the thousandth part of an inch.

The ancient tanner paid an expert high wages to guess at the contents of his hides when sold by measure. Now an unskilled workman hands the irregular-shaped pieces to a little machine that looks something like a table with a double top, which, quicker than the mind of the expert could guess it, reckons with exactness the square contents in both the metric and standard systems.

But the new processes used in tanning are most surprising. Leather used to be tanned by soaking it for seven days in a weak solution of hemlock or oak bark to give it color, then in pits of stronger solution for six weeks, moving the hides every day or so; then in "lay-away" pits still stronger for another six weeks; by filling them with new bark for another six weeks' soak, and repeating this last operation thrice or four times. All this made good leather, but it took from six to eight months. Now even the thickest hide can be tanned by chemicals in three hours.

Advantages Enjoyed by American Farmers.

AMERICAN farmers are making rapid progress in their efforts to secure the best results from the work of tilling the soil. A writer in the *American Thresherman* says: "The American farmer quickly grasps the situation. But this is not hard to understand. We have the greatest system of imparting information of any nation on earth. The farmer, be he ever so poor, has access to journals of one kind and another, from which he keeps posted in what is going on in his line of every nature. He has the agricultural colleges to teach him, and these are stimulated by manufacturers, who contribute machinery as prizes of one kind and another, and when he attends the county or State fairs he finds the new inventions on exhibition. Not only this, but the farmer himself is a partner in the improvements of the age. Most of the useful and valuable inventions for labor-saving are the work of those who use this class of machinery, and when a man can produce a model or suggest an idea which has merit in it he finds a ready market for it among the builders of machinery. The American farmer is a better-posted man than those of most other countries, and he is even outstripping himself in these days of advantages and enterprise."

Automobiles vs. Horses.—*Country Life in America* offers some interesting figures on the comparative cost of keeping horses and automobiles. Summing up the expense, this writer says a large touring car, considering depreciation and the chauffeur's salary, could and would cost \$2,405 a year, as against \$1,257 for a team of horses with coachman, while a small machine of the "second class" might cost \$525, as against \$448, for one horse. As for efficiency and use around a country place, the machines are given the preference.

Our Trade with Cyprus.—Commerce between the United States and Cyprus is as yet in its infancy, but is likely to grow, especially along agricultural lines, America buying Cyprus wools, skins and mines, the Cypriots buying from us agricultural implements and machinery, including wind and oil engines for irrigation purposes. The total trade of Cyprus amounts to \$4,000,000, about equally divided between exports and imports, and is gradually increasing.—*United States Consul G. Bie Ravndal at Beirut, Syria.*

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest
Medals:
Gold, Silver and
Bronze.

Excels on Every
Point.
Cheapest to Use in
the End.

TESTIMONIAL. NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,

(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

"NEW JERSEY" COPPER PAINT

LEADS THEM ALL,

So Our Testimonials Say.

We guarantee this Copper Paint to be the easiest to apply and, owing to its being so finely ground, it is the smoothest paint in the market.

Highest Medals from National Export Exposition and American Institute, New York City.

New Jersey Yacht Red Copper

For Yachts. Brightest Color Made.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J. U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of NEW JERSEY PAINT WORKS, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—it is splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.
MILLS EDWARD, Master Schooner "Florence Shay."

F. R. PATCH MFG. CO.,
 RUTLAND, VERMONT, U. S. A.

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing, Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering apparatus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, so that prompt delivery can be made.

HAVE YOU PURCHASED A DIAMOND BOILER TUBE CLEANER YET?

For Water Tube Boilers.

 Operated
by
Steam
or Com-
pressed
Air.

For Fire Tube Boilers.

If you haven't, you are needlessly wasting fuel every day and consequently wasting money. If fuel is difficult to procure—if it is high in price—if you value the efficiency of your boiler, you should send at once for a

DIAMOND BOILER TUBE CLEANER.

The only known and successful device for removing scale and soot from water tube or tubular boilers. Is absolutely guaranteed to do as represented or money refunded.

From 20 to 60 per cent. in fuel saved; prolongs the life of boilers, and is the means of avoiding possible accidents. Our Diamond Cleaner is used by the largest steam users in almost every part of the world, to whom we can refer you upon application. Every Diamond Machine bears this trademark as below, and is also stamped with our name.

None genuine without it.

Box containing 6, gross weight, 150 lbs.; net, 100 lbs. Cubic feet, 6 1/2.
Box containing 12, gross weight, 300 lbs.; net, 200 lbs. Cubic feet, 14.

All above articles made of steel tubing; finished, black enameled, oxidized copper or nickel-plated. Send for full particulars, prices, etc.

D. H. ALLEN & CO., Miamisburg, Ohio, U. S. A.

TIP TOP TABLE.

A first-class table, strong in construction, yet very light in weight. A handy table for the home, office, restaurant and summer garden. A half turn of the top places it in a vertical position, therefore occupying little space when set aside. It packs in the smallest space of any table yet designed and is specially constructed for export. The top is 30 inches in diameter; made of 5-ply veneer quartered oak.

The Allen Shaving Stand.

THE MIRROR is 8 x 10 quartered-oak frame.

RAISED OR LOWERED any height. REVOLVES and TILTS either way. A PEDESTAL is formed by the mirror. It makes a nice reflector and dressing stand for the ladies.

**Thousands of Protectographs**

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is **\$30**, delivered New York City.

G. W. TODD & CO., Mfrs., 40 Trust Bldg., Rochester, N. Y., U. S. A.

EXCLUSIVE AGENCIES GIVEN.

Orders executed either direct or through export commission houses.

**Bradley Steel Shelf Brackets.**

"The Most Popular Bracket Made."

Fiberlite Shade and Holder.

Shade made from fiber similar to that used for lining sockets. Mottled green on outside and pearl gray inside. Fiber finished under pressure which gives it a gloss finish, furnishing fine reflection for light. So tough that edges will not break and so springy that it cannot crush. Holder of heavy wire; one piece, clamps to socket with a catch. One catch and no screws. Fastens to inside of shade and any tendency to pull off only makes it hold more securely.

Light as aluminum shades, which means cheap freight rates.

TO INTRODUCE ABROAD:

Upon receipt of \$40.00 in U.S. gold or its equivalent, we will box and deliver f. o. b. cars at New York, five gross of these shades in assorted sizes.

A HATCHING WONDER

The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17½ inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

**CYCLE HATCHER CO., Salem, N. Y., U. S. A.****OUT-HATCHES ITS COMPETITORS!**

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.**Gem Incubators**

Are low in price, but this does not mean that they are cheaply made, or that they are inferior in any way. In fact, they are high grade in every particular and have several important features not to be found in any other hatcher.

Prices reasonable. Results guaranteed. Send for beautiful illustrated catalogue, mentioning this paper. Reliable agents wanted. Address

GEM INCUBATOR CO.,
Box A1, Dayton, Ohio, U. S. A.
200-Egg Incubator for \$12.80

The simplicity of the Stahl Incubators created a demand that forced the production to such great proportions it is now possible to offer a first-class 200-egg incubator for \$12.80. This new incubator is an enlargement of the famous

WOODEN HEN

recognized the most perfect small hatcher. This new incubator is thoroughly well made; is a marvel of simplicity, and so perfect in its working that it hatches every fertile egg. Write for anything you want to know about incubators. Send for the new free illustrated catalogue.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

PELTON WATER WHEELS

PIKES PEAK POWER CO.

The illustration herein shown is that of Pikes Peak Power Co.'s Hydro-Electric Transmission Plant, located near Victor, Colorado. It consists of three 1,000-horsepower Pelton Wheels, operating under 1,180-foot head and direct-connected to electric generator.

This electric power is supplied to the many mines, mills and other industries in that vicinity. This plant has been running day and night for four years at practically no expense for repairs. Send for catalog illustrating many other plants of similar character.

PELTON WATER WHEEL CO.

75% OF YOUR PAINT BILLS SAVED BY THE USE OF OUR PAINTING MACHINES AND READY=MIXED COLD=WATER PAINTS

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.

THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the LOUISIANA PURCHASE EXPOSITION amount to something over 12,000,000 SQUARE FEET, all of which is practically completed at this writing, and at least 95 PER CENT. OF THIS WORK WAS DONE WITH THE MACHINES WE BOUGHT FROM YOU. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

WE TAKE PLEASURE IN STATING THAT, IN OUR ESTIMATION, YOUR MACHINE IS FAR SUPERIOR TO ANYTHING ON THE MARKET.

THE COLD-WATER PAINT USED AMOUNTED TO ALMOST 400,000 POUNDS.

Respectfully yours,
BUILDERS' CONTRACTING COMPANY.

No. 3 "Rapid" Painting Machine.

Our Ready=Mixed Paints

are made from pure minerals, ground with a liquid chemical into a thick paste, which only requires the addition of water to be ready for instant use.

Our Ready-Mixed Paints are

**WASHABLE,

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the **Only** machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

NEW YORK SALESROOM: 96 CHAMBERS STREET

DIETZ Nos. 1 and 2 COLD-BLAST LANTERN BLIZZARD.

These Lanterns are the culmination of a vast deal of experiment, and are offered as something *extra good* in the Lantern line. We call them "Cold Blast," for the reason that they are fed exclusively with cold air, that which comes from above, being taken in through openings between the two rings at the top. This system of air-supply greatly stimulates combustion with the resultant extra volume and intense whiteness of its light. They are fitted with an entirely new and most effective device for raising and lowering the globe, which also locks the burner in position. They are, in point of fact, a close following of the well-known Dietz Globe Street Lamp, and, as already stated, will meet the demand of any one seeking an "extra good" Lantern. No. 2 is fitted with 1-inch burner and "Blizzard" globe. No. 1 is fitted with No. 1 burner and "Blizzard" globe.

Price, No. 1, \$13 50 per doz.
No. 2, 16.00 "

We are pleased to send complete catalogues (Spanish and English) and price-list of our complete line of Lamps and Lanterns to those interested.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2½ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

MICHIGAN WASHING MACHINE CO., Mfrs., Muskegon, Mich., U. S. A.

Also makers of the world-known "Muskegon" and "Michigan" Washing Machines, over 250,000 of which are in use throughout the United States. NOTE.—When ordering through export houses, to prevent mistakes, please mail us a duplicate of your orders.

ONCE SOLD, THEY NEVER COME BACK.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

VOSS BROS. MFG. CO.,
DAVENPORT, IOWA, U. S. A.

THERE IS NO FRICTION.
NO LOST MOTION.

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has **Revolving Steel Ball Gearing**, reducing the friction and thus making the machine so **light running and almost noiseless.**
2. The tub is made of **Louisiana Red Cypress** lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
3. **The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.**
4. **The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.**
5. The tub has a wringer box, fastened with steel brackets.
6. The lid on tub closes tight, no escape of steam.
7. Has gilded hoops, castings and name.

Prices quoted F. O. B. New York. Each **O. K. Washing Machine**, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet

NOTHING IS "JUST AS GOOD."

WE have received a letter from a correspondent abroad in which he complains that some American goods are imitated by our foreign competitors. He says:

"The imitations in appearance are not so crude as you would imagine. They would perhaps fail to deceive a person thoroughly familiar with the genuine article, but in style and workmanship they come sufficiently close to deceive people who have heard of the superior products of American manufacturers and are not disposed to take anything else. These articles, when put to the test, are inferior to American products and give dissatisfaction. In cases where the buyer detects the imitation he is told that the article is 'just as good' as the American and perhaps the price is made lower as an additional inducement to effect a sale. Cannot THE AMERICAN EXPORTER do something to correct this condition?"

Cases of the kind referred to by our correspondent are by no means isolated. About all that can be done, however, is to warn our readers that an imitation is never equivalent to the genuine article, that a lower price for something "just as good" is a danger sign which indicates poorer workmanship or some other defect in the contrivance, implement or machine—be it what it may. Do not take anything "just as good" at any time, no matter what the salesman may say. Buy what *you* want, not what *he* seeks to sell to you. Study the matter carefully as to what you want before you undertake to make a purchase and then insist on having the real article—whether it be of foreign or American make. Of course, it is to be hoped that you will want American articles—but as to the latter you will never be informed by an intelligent salesman that they are "just as good." That would not be true, for there are no better manufactured articles put forth for the lowest consistent price anywhere in the world than are furnished by American manufacturers to their customers in foreign lands. If you are already a user of American goods nothing more need be said, for you will never change. If you have not given them the test of use, it is time for you to learn by experience that you have been missing something. In any event you can rely upon the guarantees of the advertisers in THE AMERICAN EXPORTER. Our trade directory is an index to the more important and thoroughly reliable concerns engaged in the foreign trade and none others are permitted to use our columns under any terms or at any price.

POSTAL receipts are a valuable thermometer of a country's business progress. In the fifty largest post-offices in the United States for the last year New York City headed the procession with a gain of nearly 6 per cent., while the general average was slightly below that figure. The increase shows that the business of the country is moving along with a conservative and substantial growth.

MAKING WORLD'S HISTORY.

AUGUST was full of news from the Far East regarding encounters on land and sea between the rival forces of Japan and Russia. As this issue of THE AMERICAN EXPORTER goes to press it seems only a question of a few days when Port Arthur must fall into the hands of the Mikado's men. It is possible that the expected may not happen, but it is extremely improbable. The fall of Port Arthur, if it occurs, ought to bring about a cessation of hostilities and cause the belligerents to consider the question of agreeing upon terms of peace. Further prolongation of the war would not be advantageous to either side. The Japanese would be in a position to exercise a further triumphant control of the Pacific border, but their armies could only attempt to carry their campaign further toward St. Petersburg at an expense of money and loss of life that would be greater than any of the casualties which have so far happened, while the result would inevitably be the same, for we do not believe that either nation could eventually entirely subdue the other, no matter how long the warfare might be prolonged. It is to be hoped that the contending countries will try to make peace as soon as the Port Arthur incident is decided.

Russia internally, as well as in the country's foreign relations, has been the subject of worldwide interest. The birth of a son and heir to the Czar was a notable event of the month. The frequent appearance of daughters at the wrong time has been a cause of sorrow and dismay to the royal family, to say nothing of the effect upon the subjects of the Emperor. The assassination of Von Plehve, the Minister of the Interior, was another notable event in the history of Russia. Whether he was to blame or not, it is charged up to him that he was responsible for the lines of policy which resulted in the Kishineff massacres and which interfered with the expansion of Russia's trade relations with the United States and other countries.

There can be no doubt of the fact that Von Plehve had great influence not only in formulating the domestic policies of his country, but in suggesting the policies that have been pursued in dealing with Japan and other countries, either diplomatically or commercially. While the United States has nothing that it cares to complain of at this time, there have certainly been some rather annoying trade incidents, as to which comfort may be extracted from the knowledge that other countries have suffered more than ours. If Von Plehve's assassination removes an obstacle from an early adjustment of the Japanese trouble and eventuates in the establishment of better trade relations between Russia and other countries there will be people found who will say again that "good may come out of evil."

COAL and cotton are not *per se* contraband of war in the opinion of the American Government. Secretary Hay has issued a circular letter to our representatives abroad for their information, which seems to conflict with the Russian declaration that those articles are contraband of war. The Russian rules would, if literally interpreted, stop all commerce with the range of its war vessels. That is something that America can not and will not tolerate. Under some conditions coal and cotton—and numerous other articles—would unquestionably be open to seizure as contraband of war, but no inflexible rule can be put into force in that regard. The subject is full of technicalities and it is not our purpose to go into it beyond giving the assurance that the United States is determined that the Far East war shall not interfere with peaceful international commerce.

GUNS of 13-inch caliber are certainly national luxuries. It costs \$500 every time such a piece of war machinery is fired, but preparedness in the matter of great gun accuracy of fire is something of importance to the American Navy, which will use up more than a million dollars this season in ammunition for practice purposes.

WHY would it not have been a good idea to refer the question of contraband and the disposal of the prize ships, captured in the Red Sea, to The Hague Peace Tribunal? The question is one that ought to be settled by international edict and not by the arbitrary action of any one nation.

DESKS AND OTHER FURNITURE.

WITHOUT going into details, it may be confessed that the export trade in American furniture is not anywhere near as large as it ought to be. In this branch of industry our inventors and skilled artisans have produced wonderful examples of utility and artistic effect. In the matter of desks and office equipment of various kinds even more remarkable progress has been made than in the making of household furniture. In both lines our mechanics have earned laurels from those in America who are using the products of their genius.

The export furniture trade has not, perhaps, been prosecuted as effectively and as industriously as might have been the case if climates and other natural conditions were the same all over the globe. Years ago attempts were made to send temperate zone furniture into torrid zone countries, with quite unsatisfactory results. In this respect, we understand, exporters of ordinary furniture who are attempting to do business have long since used screws instead of glue for countries where the torrid heat might melt the latter. Desks are more expensive than ordinary furniture, perhaps, for purchasers are more critical and the usefulness of the article is in more constant, urgent demand. The development of the roll-top desk began more than twenty years ago, and it has proceeded to a point where we do not think American goods in that line can be excelled either for usefulness or artistic effect.

This editorial is written on a walnut roll-top desk purchased nearly twenty years ago. The desk has since been through climatic changes that would destroy the usefulness of any but a well-built piece of furniture. For one long summer it was left practically unprotected in a section of the country where the heat and dampness were as trying to either human endurance or anything else as can be found anywhere in the United States. The desk came out of that and other sieges of the same sort in a manner that reflects credit upon the artisans who constructed it. If this identical desk were to be offered for sale it would need a little polishing, only a little, for editors are proverbially careless about the tidiness of their desks, but otherwise it is one of the strongest testimonials that anybody would want of the worth and durability of an article of this kind of American manufacture.

It will be observed by our readers that we write with some interest upon this subject. It is only the interest that comes from personal appreciation of an important industry, from an experience in the use of a desk that has been pulled apart and erected close to ocean breezes and dampness, that has again been torn apart and transported to a miasmatic, swampy region with a temperature close to 100 and a humidity that caused the desk to be left to its own fate for months. The vicissitudes of this particular roll-top desk would make a longer and more interesting story than we have the space to tell, but the moral of it all gives proof of the excellence of the work of the men who built it. Since this desk was made many improvements in construction and ornamentation have followed, but its serviceability, durability and satisfactory appearance are a tribute to the men engaged in this industry. A desk, more than anything else, one wishes to buy for a lifetime. It is not a piece of furniture that can be changed in an office or a home, as are the fashions in attire, so that every one must necessarily want to have the best—a best that will stand the test of years. In this direction there can be no doubt about the economical availability of American desks. If one of twenty years' age and much knocking around is now worth its place as the chief piece of furniture in an up-to-date office with electric lights, telephones and all the modern accessories of business convenience, it seems to show that Americans *know* how to manufacture office furniture.

OUR export trade for the last month exhibited gratifying increases in agricultural implements, wire, wire nails and pipe. Without going into details, it may be said that the increase represented thousands of tons. As to these necessities, people in other countries are coming more than ever before to recognize that our manufacturers furnish the very best goods that can be obtained for the money.

THE COTTON CRISIS.

PROBABLY the most important matter of international industrial concern at present is what is commonly called "the cotton crisis." It is agitating almost every country in the world, but Great Britain and the United States are more affected than any other countries. The chief trouble is with the speculators in commodities. In America these speculators in recent years have lost all they made, and more than that, in attempting to corner cotton, but that has not prevented others from suffering through the effects of their operations. A cable report of the meeting of the British Association at Cambridge last month, in which Premier Balfour participated, records the fear of Mr. Balfour that "gambling in futures cannot be stopped." That, of course, is the bane of the cotton industry.

The cotton crisis in America has come down to almost normal conditions. The chief figure in it has been forced into bankruptcy. That has not lessened the evil effects abroad, if we are to judge by what Mr. J. A. Hutton, one of the chief speakers at the meeting, is reported to have said. Mr. Hutton estimated that no less than 10,000,000 people in Great Britain were more or less dependent on the cotton trade. The employers alone, he said, were losing \$200,000 a week through short time, and the total loss to capital and labor in the cotton and other allied trades throughout the country was not less than \$1,500,000 per week, or \$75,000,000 per annum.

The American mills have not suffered to the same extent, through prudent management and a closer survey of conditions. Americans generally deprecate attempts on the part of anybody to force abnormal prices or create unnatural conditions.

OUR FARM IMPLEMENTS.

ON another page of this number will be found an article describing the exhibition of agricultural implements at the American Exposition at St. Louis. That the exhibition is a credit to our implement makers and a monument to American ingenuity and American industry we think all who have seen it will agree. While not so large as the manufacturers would have had it, if the space allotted to them had been adequate, the exhibition is a truly representative one, and if it can be said to be wanting in size that defect is fully counterbalanced by the excellent quality and widespread variety of the machinery and implements shown.

To foreign visitors interested in the cultivation of the soil a day spent in this section of the great fair cannot fail to be an object lesson regarding improved agricultural aids and appliances, the benefits of which will crop out when they return to their individual fields of labor in increased orders for American appliances and more profitable tilling of the soil which they may have under cultivation.

ACCORDING to the census of 1900 the wealth of the entire United States is estimated at ninety-four and a quarter billions of dollars. Of this amount, New York claims more than thirteen billions—an astonishing total and one before which the dominance of the metropolis as the chief center of the country's wealth must be conceded to be indisputable. More surprising than the amount itself, perhaps, is the rapidity with which this great wealth has been accumulated. Twenty years ago, the actual valuation of real estate in what is now the Borough of Manhattan was only \$1,376,000,000, as against \$3,676,000,000 for the present year. The amount of personal property actually taxed has increased proportionately. The amount of real property recently returned for taxation is more than \$5,000,000,000. Taxes are paid on nine hundred and twenty-eight millions of personal property.

WIRELESS telegraph stations will not be controlled by the Government in America in times of peace, but the joint Navy and Army Board will be kept informed regarding the stations erected and their foreign connections, so that in time of war the board, representing the Government, can take full and intelligent control of the stations. A proposition was made that the Government take entire control at all times of the wireless systems operating on the American coasts, but the idea has met with disapproval.

AUTOMOBILE FIRE ENGINES.

AUTOMOBILES are holding the center of the stage in America at present. There were successful endurance tests last month, half-way across the North American continent, which gave new evidence of the progress that is being made by our manufacturers. As previously noted in these columns, this industry has been progressing rapidly within the last year or two and our inventors are branching out in every direction. One of the latest forms of practical use of the automobile is the equipping of fire apparatus. Autos are now being used by the firemen in several cities and even the big engines and trucks, which now require three horses to drag them, will soon be run to fires by their own power more speedily and with more economy of motive power than can be had under the old system.

Experiments in automobile fire engines have been made from time to time during several years, but until recently the inventors have not been able to approach the perfection of operation that is essential in large cities with crowded streets. Despite the difficulties which have been met, it is certain that some of the new machines will be found to have solved, within a year, the problem of the automobile fire engine. Persons who have no actual, practical knowledge of the use of fire apparatus in large cities cannot fully realize the extraordinary demands that must be met in producing an automobile fire engine that is as efficient and reliable in speeding to fires as is the horse-drawn machine.

In the New York City Fire Department numberless automobile engines have been tested during the last few years and more than a score of years ago a steam-propelled fire engine, based on the traction engine principle, was put in service. It was so slow and it frightened so many horses that it was quickly retired from active use. The chief trouble with models of auto fire-engines so far officially tested has been the tendency of the vehicles to slide or "skid," as the firemen call it. This difficulty will soon be overcome and it is a safe prediction to make that within five years horses will no longer be used in the fire department of any American city.

It must not be thought that American genius in this field is confining its efforts to producing fire-engines alone, for that is not the truth. We have pointed out from time to time in the last year the progress that is being made in manufacturing both pleasure and commercial automobiles and some marvelously fine specimens are in general use in this country. Up to within two years the foreign manufacturers were ahead of our makers, but the tide began to turn about that time and the great bulk of the enormous demand for automobiles in America is now supplied by our home producers. So great, however, is the increasing call for self-power vehicles, that our cousins abroad still supply us with their vehicles; but considering the total volume of trade in the industry, the percentage of imports now amounts to about 5 per cent. of the whole, whereas two years ago foreigners supplied us with 90 per cent. Americans are shrewd enough to buy the best that they can obtain for the money—just as they expect others to do—so that this exhibit of the worth of our automobiles is a guarantee that they are all right. Opportunities will soon come to our friends abroad to purchase as good American automobiles, for private or business uses, as may be obtained anywhere in the world.

PERSEVERANCE is a virtue that in a good cause always merits success. Sir Thomas Lipton, we learn, intends to make another effort to capture the America's Cup, trying a new and fourth Shamrock for the purpose. Sir Thomas's loyalty to the shamrock has never been questioned, but some of his American friends, who would like to see such a plucky sportsman win once, at least, out of half-a-dozen times, have suggested that he quit the Shamrock for a name and call the new yacht Young Hyson, or some other name in keeping with the other half—the commercial part—of the challenger's life. But whatever he may call his boat, he will be assured of the royal welcome due to a knight of his sportsmanlike valor.

WHILE other nations in the Orient are engaged in making war China is increasing her patronage of American goods. The volume of business reported last month in cotton goods was greater than has occurred for more than two years.

AUSTRIA INVADES AMERICA.

AS we close the compilation of the current issue of THE AMERICAN EXPORTER, the New York Board of Trade and Transportation is in momentary expectation of the arrival in this country of a delegation of Austrian bankers, manufacturers and merchants, including wholesalers, importers and exporters. The delegation represents the "Austrian Trades' Association," which, we are informed, is the largest and most influential commercial and industrial organization in the Austrian monarchy. The avowed object of the invasion is to make a close study of American business methods and conditions with the purpose of establishing stronger commercial relations between Austria and the United States.

The delegation will receive a hearty welcome, and every effort will be made by Americans to extend all possible courtesy and information to the Austrians. In recent years we have been favored with similar visits by large or small delegations from almost every country on the face of the globe, excepting Austria, Turkey and some very much smaller countries. Austria's geographical location, with reference to transportation facilities, has perhaps been an obstacle in the way of greater trade communion between the two countries. However that may be, such obstacles are gradually disappearing and new methods and ways of communication are coming into vogue in various parts of the world wherever and whenever the necessity for a change is made manifest. We have no doubt of the fact that the visit of the delegation from Austria will be of great benefit to both the monarchy and the republic. The visitors, in any event, are cordially welcome.

TEMPERANCE and economy are given as the reasons why the United States has won first place from Germany in the production of beer. The product of the German brewers was more than 132,000,000 gallons less than the output of the American brewers. According to the American Consul-General at Berlin the "falling off is accounted for variously—cold, wet weather; spread of temperance principles; practice of economy by the middle classes, and the abolition in many shops of the 'beer pause' and the substitution of tea and coffee as beverages." America is not desirous of acquiring the fame of leading the world in the production of beer or any similar beverage, but our brewers have acquired such skill that their beverages are in increasing demand in other countries. If it were not for that demand there would be no reason for the greater output. Our mechanics do not enjoy or tolerate the "beer pause," nor have they done so for many years. The American workingman, as a type, is abstemious and he is growing more temperate as weeks, and months and years pass backward into Time's archives. Beer used in moderation, like other articles of the same nature, is beneficial to some men, although injurious to others. It is an article of trade and commerce and the fact that our brewers are able to produce such an excellent article redounds to their credit, while it does not reflect upon the American workingman in any way.

BARON SPECK VON STERNBURG, the German Ambassador at Washington, has taken position in the front rank of the foreign diplomats accredited to America, and his activity is of value to both countries. Despite his many duties, he has accepted the presidency of the National Advisory Board of the American Institute of Germanics, of the Northwestern University, U. S. A. The institute was founded to cultivate in the universities and in the country at large a deeper and wider interest in the result of German civilization, language, literature, history, archaeology, art and music, and also to draw closer the bonds uniting Germany and the United States. Baron von Sternburg is amply equipped to push forward the work which he will have to supervise.

OUR British and Australian readers will be interested in the story which we publish on another page, from Ottawa, Dominion of Canada, regarding the desire of that dependency of the Crown for an independent consular service. The idea is one that cannot be discussed in a short editorial paragraph, for if carried into effect it would have far-reaching results upon the political and commercial interests of the world.

USE OF AIRSHIPS IN WAR.

WHILE the spectacle of two nations engaged in sanguinary contest and sacrificing thousands of lives does not lend very strong confirmation to the truth of the adage that the best method of securing peace is to be prepared for war, recent military developments point to the possibility that the present struggle, with its enormous loss of life, entailed by the destructive engines of modern warfare, may prove in the end to be a stepping stone to the universal peace which the greatest minds in every known nation hope to see attained.

It would indeed seem that the war between Japan and Russia were to take us a long way on the road to realizing that the only absolute preventive of war would be that its consequences were so terrible that no nation would dare to enter into hostilities with another.

Frank B. Stockton, in his brilliant novel, "The Great War Syndicate," vividly presented such a war to our eyes. He depicted an entire island disappearing by the use of a terrible explosive dropped from an airship, followed by a warning to the belligerent nation from the manager of the "War Trust" that its continent was next marked for destruction. Peace terms were at once arranged.

Other imaginative writers have followed in Stockton's vein and the world could afford to smile at such pictures as the product of the authors' florid fancy so long as such airships and such explosives were existent only in the brain of the sensational writer of fiction. Yet, even before Stockton's story appeared, science had taken long strides in the direction he indicated.

Only five years ago—and since then science has not stood still—the world was presented with the sober declaration, drawn up by a deliberative peace commission, representing all the great powers and signed by the heads of all the great nations, to the effect that the launching of projectiles and explosives from balloons and other new methods of a similar nature were prohibited in the warfare of civilized nations until a date which has just been passed.

In the meantime the same civilized nations have been busily engaged in working out plans for all kinds of flying machines and aerial devices to be employed in peace and war. Some day somebody is going to invent an airship that will really fly and will answer to its helm as readily as a ship in the ocean. Perhaps it has been done already. But if a practical airship has been invented, or shall be invented, war in the future may be made so terrifying, so astoundingly destructive, that the speculation of the fabulists may become a verity.

The proscription adopted at The Hague conference alluded to expired on July 29th last, and by its expiration a new and awful mode of destruction of life and property is made permissible by the international code. The effects of such a warfare—if science has advanced far enough to admit of them—are startling. By the projection of high explosives from a dirigible balloon or airship entire armies might be annihilated at one blow; whole squadrons of battle-ships instantaneously wiped out of existence.

If we learn with horror of the havoc wrought by the present methods of modern warfare pursued in the Russo-Japanese struggle, what would our feelings be upon receiving the news that a fleet of aerial warships, hovering over Port Arthur, had blotted that stronghold off the face of the earth. And spectacular as the idea may appear to our minds it is not beyond the bounds of possibility.

WE have frequently mentioned the postal receipts of the American post-offices as being a barometer of our prosperity. The last statement, for a full year, shows that the average gain has been 6 per cent. in the fifty largest post-offices in the country. Considering the fact that in Presidential election years in the United States there is invariably a dulness in trade, the showing confirms our predictions of a steady, healthful growth of business.

SOUTH AFRICA last month took some large consignments of American agricultural machinery. The people in that region seem to be prospering more than ever since the Boer war ended, and there is apparently no diminution in the demand for American machinery in that part of the globe.

EVOLUTION OF WORLD'S TRADE.

IN the development of modern civilization it will be found that, after all, the world is a great piece of material machinery. Every country will be found necessary to the perfection of the complete machine. All will be cogs in the apparatus that closer international commercial relations will erect. A writer in *Gunton's Magazine* furnishes the following text upon which thousands of words could be written regarding the future of the world from various points of view:

"The marvelous progress of Germany during the last quarter century rests mainly upon the development which has made her a leading factor in the struggle for the markets of the world. During this brief period full many a German town has been transformed from a hamlet of a mere handful of people to a thriving center of industry. The productive power of the empire has more than doubled. During this period also her artisans have been fed from the granaries of the United States. It is no reflection upon the German people to say that this supply of cheap food has been and still is a factor of paramount importance in her industrial development. German soil, which is not especially fertile, is unable to furnish food for the rapidly increasing population of Germany. When two decades ago Bismarck advocated a high tariff upon foodstuffs, Germany's home supply of food was more nearly equal to the demand than it is today or will be to-morrow. The fact is that the expansion of German industries has been accompanied by a growth in her population that has outrun the increase in the productive power of her soil."

We do not propose to enter into such a discussion of the subject as seems entirely warranted. We want our readers to do some thinking for themselves, and will only say at this time that the agriculturists, the merchants and the manufacturers of the United States are prepared to do all they can to aid in the development of the photograph of perfect civilized effort and industry which is bound to be ripe for taking before many more years have elapsed. Our granaries may feed Germany and aid her skilled mechanics, but our own splendidly serviceable agricultural machinery will thereby be in greater demand at home, where it is appreciated as much as it is on the myriads of farms elsewhere in the world, where anything but an American mower or reaper, or other article in this line, would now hardly receive polite consideration. There is room enough in the world for everybody. Americans engaged in the export trade do not decry the goods of their competitors. They look upon competition as being the life of trade and the incentive for increased effort towards furnishing the best machinery and other goods that can possibly be produced for the values placed upon the products—which are always based upon a moderate living profit. Our manufacturers do not sell "below cost," but they *do* sell so slightly above it that purchasers in the export trade, as well as at home, always get the full worth of their money.

CUBA has been prospering greatly since she became a Republic. A contract has recently been awarded to an American firm for an extensive electric railway system in the southern portion of the island, and similar orders for American machinery are coming in with a regularity which bespeaks much for the future of our little sister. Cuba seems to have taken on the progressive spirit that is becoming such a feature and such a factor in the social and commercial life of the North American Continent.

READERS of THE AMERICAN EXPORTER will greatly facilitate the answering of inquiries if they will mention the issue in which articles appeared, and, if possible, the page of that issue. All inquiries received from subscribers to the paper are attended to with reasonable promptness, but delays are inevitable unless the request for information gives the data mentioned.

ICE-MAKING machinery, which has well-nigh reached perfection in America, is in greater demand abroad than it ever was before. Some recent exportations have been unusually large.

BELLIGERENTS BUY FROM U. S.

Millions of Dollars' Worth of Goods on the Seas Liable to Seizure as Contraband

AMERICA'S trade with Russia and Japan has increased 100 per cent. in the last year, and its further growth is limited only by the ability of the buyers to pay and the belligerents to enforce the rather uncertain provisions of international law in regard to contraband goods. At the present writing American merchants have upon the high seas, consigned to Japan, goods to the value of \$7,000,000 which in part or wholly are liable to seizure as contraband of war. Consigned to Russia, merchants of the United States have at sea goods of like nature and of about half the value of those en route to Japan.

Both these powers are good customers, but so far only Russia has taken decisive steps to prevent the movement of this class of goods. It is known, however, that Japan is not resting quietly, but that in this country, as probably elsewhere, she is informing herself of every purchase made by Russia and that the whole matter of contraband trade soon may become the subject of international inquiry.

To meet this condition the United States Government has informed itself precisely as to the volume, direction and details of this trade. It is not understood that any measures are to be taken at this time either to prevent it or to support it, but that the knowledge is to be used as emergencies may arise.

Although it is supposed that a considerable business is done in munitions of war, the experience of the trade has been so ample that the lesson of secrecy has been well learned. Notwithstanding it is known that the armies of several nations have been equipped with American arms, the export records of this country do not show that any arms ever left our ports.

For example, several years ago, a certain company furnished 275,000 breech-loading rifles to Egypt. General C. P. Stone, chief of staff of the Egyptian army, it has been alleged, made the purchase. The arms are said to have been shipped as machinery to be used in moving the obelisk which stands in Central Park, and were so billed and delivered. There was no particular reason at that time for such secrecy, for no war was being fought or impending, but the circumstance illustrates the secretive character of the trade.

The Russian Government has been informed, it is said, that one hundred packages of sewing machines shipped by the steamship *Empress of India* from Vancouver on July 25th are in fact rifles from an American arms factory. A shipment of this size, however, is regarded only as a sample lot; but it has taken a tortuous and what would appear to be an expensive route, being delivered at half a dozen different cities in the interior of the United States and taking a zig-zag course, half across the continent, by rail, canal, river and lake route before reaching Vancouver the port of actual debarkation from the United States. The consignment was reshipped and rebilled at each of these places of call and on arriving at Vancouver it was not only rebilled, but the packages were remarked before it was put on board ship for its actual destination.

It is therefore next to impossible to obtain accurate information as to the movement in actual munitions of war, such as ordnance, powder and explosives generally, especially such shipments as are intended for Japan. Because geographical and other conditions prevent Japan from exercising supervision over ships bound to Russia, the trade with that country is less circumspect and is moving with customary openness, except, of course, that regarding actual munitions of war.

Among the items appearing on invoices are silk and catgut ligatures, sulphate of quinine, proprietary medicines, surgical instruments, antiseptic bandages and sponges, camphor—which, by the way, is the basis of smokeless powder—and a certain form of chloride, of which there is one shipment of 1,000 gallons worth \$1 per ounce.

That in three months there have been shipped to the East as an entirely new commerce four and one-half million dollars' worth of medical supplies shows how the current of trade is setting. As an illustration the shipment of surgical instruments is suggestive. The firms engaged in this work have consigned in round figures about one hundred thousand dollars' worth of goods to the East. All are paid for, so that the interest of the sellers is to the future of the trade rather than the shipments themselves, many of which are still afloat.

American Machinery in Japan.

A CORRESPONDENT of *Modern Machinery* sends an interesting letter to that journal about the introduction of American machinery into Japan. He says: "The problem of introducing new machinery into the mills and the shops of Japan is not longer the puzzle of old. The ancient superstitions have given way to the newer ideas, and wherever your correspondent visited he found many examples of modern machinery in service, and the outbreak of the war did not appear to materially alter conditions. The machine shops have been among the first to admit new types of drilling, planing and general up-to-date machinery, there being some very modern tools in use in some of the machine and metal-working shops of Nagasaki and kindred places. The mode of introducing the machines and tools of recent design has been somewhat singular, owing to the prejudices which prevailed. Then, again, other nations tried to get their machines and tools in ahead of the American designs, with the result that competition has been sharp all along the line."

"With the advent of modern machinery in the shops of Japan, the old styles of crude hand tools have rapidly passed away. The remote towns of the hills in which there are shops are about the only places where the ancient handworking mills and the crude bellows of the apprentice can be seen. One may find effective blowers and steam devices in running order in any of the shops. For a long while screws were manufactured exclusively by hand systems, and in parts of the empire the hand-made screw, with its blunt point, still exists, but I saw some of the most modern screw-making contrivances in successful working order in the early part of this year."

"The war was well in progress when I visited the shops of Japan, and was informed by the proprietors and superintendents of the additions they intended to make in the line of tools and machinery to meet the needs of the war. Machinery was being put in for working on the ordnance of the country. I saw a number of heavy cannon in process of being turned for the Japan navy. Pumps, boilers, pipes and all parts of war craft were in and about the shops waiting for repair or reconstruction. Then, as the usual building and engineering operations seemed but little affected by the progress of the war, the shops and machinery on the usual line of work were in running order and some of them putting in new machinery. Wherever I went I met with instances of the advent of new machines."

"In the line of woodworking machinery and tools there seemed to be much advancement over the conditions prevailing when your correspondent visited the same districts in 1898. I was in Japan then, en route to the Philippines, and there seemed to be considerable prejudice against introducing new designs of tools or machines. The carpenters and the cabinet-makers clung to their crude designs of implements, some of which were totally unfit for the service to which they were put, from the standpoint of the American cabinet-maker. Some of our makers of woodworking tools and machines sent apparatus to the Japanese workers, and nowadays one can see the American devices in service in almost any of the woodworking shops of the country."

Some Truth About Our Trade with Japan.

HAROLD BOLCE, in the September number of the *Booklover's Magazine*, writes interestingly about Japan. He says in part: "It is a matter well-calculated to awaken American enthusiasm that progressive railway promoters from the United States are figuring on taking an active part in the new railway régime of the Sunrise Kingdom. It is not too much to hope that it may mark America's substantial and permanent invasion, commercially, of the rich fields of Asia. For there is a great amount of patriotic exaggeration in the United States in regard to the part America has taken in the development of modern Japan. It is a prevalent misconception, for example, that we have built up a great trade in manufactures with that country. As a matter of fact, if American exporters should sell to every individual of Japan's 45,000,000 of people one dollar's worth of goods in a year, our shipments of manufactured products to the Sunrise Kingdom would be quadrupled. In 1902, before the threat of war had affected the market in the Far East, the total value of articles of domestic manufacture sent from the United States to Japan was a little more than nine and a half million dollars."

Japan, nevertheless, is a country that wants our goods, manufactured or otherwise, and the only reason why trade has not been larger is the lack of transportation facilities, which will soon be overcome when James J. Hill's mammoth steamships, the *Minnesota* and the *Dakota*, are placed in service on the Pacific Ocean. The present war in the Far East will greatly reduce the number of able-bodied men in the country and either labor-saving machinery or its products will be in greater demand for some years to come. The excellence of American articles of this description is well known in the Japanese Empire.

A New Argument as to the Chinese.

IN an article, entitled "The Folly of Chinese Exclusion," in the *North American Review*, Mr. Hubert Howe Bancroft, the historian, condemns the policy of preventing the Chinese from coming to the United States. Mr. Bancroft characterizes the Chinese as the best working foreign element in the world, the least harmful to American politics and people. One seldom or never sees a drunken or disorderly Chinaman. He is seldom found in institutions supported at public expense. He is not found begging or soliciting. Indeed, the argument of the exclusionists, that the Chinese will not become one of us, marry our daughters, manipulate our primaries, run for office and rule the country, is only an enumeration of reasons why they should be admitted to do the lower class of work which white men do not care to do. Mr. Bancroft continues:

"Some have suggested danger to the Republic in thus leaving open the portal for the unrestricted inpouring of Asiatic hordes to kill and drive us into the eastern ocean. Yet, they must know that the laboring man in China dares scarcely go from one province into another unprotected. The price of passage to California is to them equivalent to a fortune, and the journey like the journey into another world. In times past, he who adventured alone had often to sell or pledge his wife for the necessary means, while contractors for coolie labor would not bring men over at less than some fixed price. As for the rest, the law of supply and demand regulates it. It is a matter of record that, when wages in California fell below \$15 a month, Chinese immigration not only ceased but the tide turned the other way. Chinamen will not leave home and face the cost and dangers of the ocean voyage unless they can have work at remunerative rates; and work is all that they desire."

TELEGRAPHY HARD TO LEARN.

Word Signals of American Phillips Code as Difficult as a Foreign Tongue.

BY the general public telegraphy is looked upon as a purely mechanical occupation, calling for comparatively little skill, judgment or intellectuality, and by many operators is regarded as a mechanical medium whose duty is merely to transfer the thoughts of superior minds from one locality to another.

Nothing could be more fallacious than this view, says a writer in *Popular Mechanics*, and those who hold such opinions have little knowledge of the real duties required of modern telegraphers. Telegraphers must have quick wits and splendid memories in order to succeed; their work is one of the finest of mental trainings and has often resulted in elevating telegraph operators to high stations in life.

Railroad telegraphy and telegraphy by the Phillips code, as now employed by the American Associated Press, require a high degree of intelligence. The modern telegrapher must be an expert typewriter as well as telegrapher, receiving news matter by ear and typewriting it at the same time. In the Phillips code there are about 2,000 combinations and signs which the operator must have literally at his fingers' tips. This code consists of words and signs which, in themselves, constitute a language nearly as difficult as the Chinese, and which are absolutely unintelligible to any but the expert operator.

Here is a copy of a press message recently sent out by wire:

"T potus, ixs wi km to Kevy his itn to oa sign t agm q Pip qsn."

Written out in full, as the receiver translates it on the typewriter, the message reads:

"The President of the United States, it is said, will communicate to King Edward VII his intention to at once sign the agreement on the Philippine question."

In the Phillips code nearly every letter in the alphabet is employed singly to denote some combination of words, and words are used to represent phrases. Thus "hog" means "in consequence of," "kaw" means "adjourned sine die," and "ckx" means "committed suicide." Here are the first sentences of a press dispatch as it was received over the wire. It was sent from Chicago. Leaving out the date line, it runs:

"A dsx fi at 2 oc tsm nry rekd t sto oqd bi Cx Smith Bros on Sta str. T origin f fi is unkn. Iw fs dgd bi ofc Obien dily bakf ofs q er floor. T flas wr shootg k entrance q alley es t awng hr ws in fls. T fi dpm tru an er, was cld to thr sto on Madison str es wn t engs arvd t flas wr mkg gd hedwa d rera prt f bldg es smoke was isng fm all prts f bldg."

The operator takes this message by ear and writes it off on the typewriter as follows:

"A disastrous fire at 2 o'clock this morning nearly wrecked the store occupied by Smith Bros., on State street. The origin of the fire is unknown. It was first discovered by Officer O'Brien directly back of the office on the lower floor. The flames were shooting out of the entrance on the alley and the awning there was in flames. The fire department, through an error, was called to their store on Madison street, and when the engines arrived the flames were making a good headway in the rear part of the building, and smoke was issuing from all parts of the building."

Improved Appliances for American Electric Cars.

IN a recent report of the Railway Commissioners of the American State of Massachusetts a notable decrease in the number of surface-car accidents in the State during the last year is credited largely to the adoption of methods and devices designed to better insure the safety of the traveling public. In this report the newspapers naturally find matter for congratulation, but, at the same time, it is pointed out that the success so far achieved in the direction of safety should be the strongest kind of incentive to further effort along the same lines. In this connection it may be interesting to note for the benefit of our readers some of the appliances or devices that call forth the approval of the commissioners.

The arc headlight is, perhaps, one of the most important. It brilliantly illuminates the track for a long distance in advance, enabling the motor man to avoid collisions. It also becomes an object of such glaring prominence in all the surrounding landscape that no one can be unaware of the approach of the car at night. It is more effective as a prevention of accidents than any warning signal yet devised. Very few if any arc headlights were used on street cars prior to 1902.

Among the newer safety appliances is the whistle which is now coming to be generally employed in place of the bell on cars which are equipped with air-brakes. A whistling apparatus upon any other than a car with air-brakes seems to be impracticable. With such favor, however, is the airbrake now regarded by the most progressive street-car managers that the time appears to be not far distant when all trolley lines on which cars run at high speed will have air-brakes on all their cars, as a measure of economy, if for no other reason. The cost, large as it is, will be found to be very much less than that of paying damages. Results achieved by the most up-to-date devices of this kind show that the most heavily laden trolley cars running at their highest speed can be brought to a full stop almost instantly.

Curiously enough, the motorman's vestible, which was opposed so strongly by many street-car officials a few years ago, is now declared to be

an important element of protection from accident liability. Moreover, they are coming to be regarded as hardly less needful in summer than in winter. This is because of the immense increase of speed, particularly on interurban lines, where the motorman not so protected is liable to be partially blinded by the violence of the wind, often mingled with dust.

A minor but by no means an unimportant safety factor is mentioned by superintendents and other officials referred to in this report. This is a newly invented "bicycle seat" for the motorman. It is no longer believed by his employers that he should be compelled all the time to stand. They say that he can do his work just as well, and be in much better condition for doing it toward the close of a hard day of strain upon the mind and muscles, if he is permitted, while at his post, to occupy this ingeniously contrived seat, which leaves him free and ready for every needed action, except perhaps in emergencies, when he can instantly change to a standing posture.

A subject that just now is being freely discussed among trolley engineers is that of employing a system of block signals on street-car lines, similar to those which have been adopted with such good results on all the principal steam-car roads. Progressive street-car magnates are extremely alive to the importance of doing in some way what is done by the block signals. Unfortunately, no satisfactory system suitable for electric-car service has yet been proved to be in existence. The difficulty is that the electric current used in moving the cars is liable to interfere with the current employed in operating the signals.

The commissioners' report notes the fact that on all the best-managed interurban roads in Massachusetts cars are now run in accordance with orders from the central offices transmitted through telephones. At each turnout on a single-track road, if it has up-to-date equipment, there is a telephone station. Within the past few months very many such telephones have been inclosed in booths. This method is analogous to that in use on all first-class steam railroads, where trains are run according to orders telegraphed from headquarters.

One of the most important safety inventions recently applied on trolley systems is an instrument by means of which the despatcher at the central office can almost instantly shut off the power all along the line, including every branch line, in case he learns that some one has blundered, and that, therefore, a collision is imminent. So near perfection has the present system of information at and control from the central office been brought that the despatcher comes very near to knowing where all his cars are throughout the most extensive street-railway system at each moment of time.

New Light for Photographing.

NOT since the dry plate came into use, a quarter of a century ago, has so important a discovery been made in the photographic field as the new light recently adopted by one of the leading photographers in New York. If it proves to be all that its sponsors claim for it, the new light will fall little short of revolutionizing the art of photography, more especially as regards the taking of portraits.

While the new light is in reality an electric light working through the fusing agency of mercury—a form of Crook's tube—it is far superior to any form of electric lighting hitherto applied to photography. By its aid results are achieved that from an artistic standpoint could not be approached by the old methods.

Flash light and electric light have long been used, but the first is chiefly valuable for emergency work, where the exposure must necessarily be short and natural light is unavailable, as, for instance, in making a picture of a numerous group. With arc and incandescent electric lights good work has been done and engravers who use the photographic process now work entirely with electric arc lights instead of sunlight.

So great has been the progress in the art that the exposure of one one-hundredth of a second on a cloudy day or a thousandth part of a second on a bright day will produce with quick-acting plates excellent results; while pictures taken, developed and printed, all at night, absolutely sunless photographs are common. But all these have heretofore lacked the qualifications for artistic lighting. Flash lights often make people look like lunatics, and the electric light effects have usually been very mechanical.

By the new system the inventor has been enabled to banish the sunlight from his establishment completely, and he says he can take better pictures at midnight than he was able to do formerly at noonday.

Process for Taking Colored Pictures.

DR. ROBERT W. WOOD, professor of experimental physics at Johns Hopkins University, U. S. A., recently has been granted a patent by the United States Patent Office covering all rights to color photography. Several American photographers claim to be the discoverers of color photography.

For five years the Patent Office had prosecuted an exhaustive research to ascertain the rights of the process to an exclusive patent which this affords all processes based upon it. The patent will protect Dr. Wood's rights upon the derivative invention.

The process at present is valuable chiefly from an academic standpoint. The photographs cannot be made on paper, but only upon glass slides, and a special viewing apparatus or electric lantern upon a screen must be used to get the optical results. Duplicates are easily made.

CARNEGIE'S LATEST GIFT.

Plans for New Technical Schools in America on a Colossal Scale of Liberality.

WHEREVER American enterprise has introduced American implements or machinery the name of Pittsburg, the great center of the American iron and steel industries, the city whose skilled mechanics have been responsible for so much of the marvelous advancement the last fifty years have seen in those industries, is familiar on the lips of men of affairs. Not so familiar as a center of educational progress is the name of the great industrial hive of the Middle East. And yet, owing to the imperial generosity of one of its sons—and, too, only a son by adoption—Pittsburg can claim rank, and have no fear of the comparison, with any city in the world where the intellectual advancement of the people, has its proper place in the scheme of civic administration.

Though Andrew Carnegie has scattered the wealth he accumulated in Pittsburg over the vast surfaces of two continents, his hand has ever been most lavish in the community that saw his rise from poverty to affluence; though he has given with no niggard hand to the country of his birth, his best and greatest gifts have been to the country of his adoption.

Speaking of Andrew Carnegie's generosity to Pittsburg a writer in the *Brooklyn Eagle* recently said:

"It includes the great library, from which the citizens of Pittsburg borrow no less than half a million books every year; the Music Hall, that gave to the Pittsburg Orchestra the impetus that has made of it one of the leading musical organizations in the country; the Art Gallery, in which the great masters of Europe and America compete for the annual prizes, and the Science Museum, which has conducted researches in South America, Mexico, Wyoming and among the relics of the moundbuilders of the Ohio Valley that place it in the first rank among the scientific and ethnological institutions of the country.

"These four are all housed in an imposing structure, at the entrance to Schenley Park, that forms one of the show places of the city.

"In addition to this, the institute includes six branches in the city limits, in all of which the libraries are the principal features."

Now comes the announcement of the approaching realization of a later, more liberal gift than all the others, the great technical schools, the initial work on which has been begun.

When the gift of technical schools was announced, a good many people seemed to think them superfluous. Yet, before the excavating was begun, before the first foundation stone has been laid, before the plans have even been drawn, more than 5,000 applications for admission have been received, and the number is being added to every day.

How much the Carnegie technical schools will cost no man knows—and the man who has promised to pay the bills does not seem to care. It is stated on good authority that the buildings and equipment probably will cost in the neighborhood of \$5,000,000. An endowment of \$2,000,000 already has been provided, but this will be very largely augmented. It will scarcely be less than \$5,000,000 and should so great a sum be needed it will be double that amount.

The schools are designed to provide technical instruction free for men and women in scientific and industrial pursuits.

In the outline program prepared by the committee six groups of buildings are designated.

The first group will contain the administrative offices, sample rooms for exhibition of the work of students, reception rooms, social rooms for men and women, auditorium, lecture rooms, club rooms, gymnasium, etc. A separate building will also be provided for the residence of the director.

The second group, or School of Applied Science, is designed exclusively for advanced scientific and technical courses. In it will be taught mathematics, drafting, machine design and construction, structural steel design and construction, general, industrial, electro and metallurgical chemistry, mining and railroad practice, applied electricity, steel manufacture, clay working and ceramics, glass manufacture and foundry practice. No other school in the world attempts instruction of the character that will be imparted here.

The divisions of clay working, ceramics, glass manufacture and foundry practice will be equally complete and practical.

The third group, for apprentices and journeymen, is designed for boys and men over 16 years of age, seeking instruction in the building, mechanical and allied trades.

In group four will be given both technical and trade courses for women.

The division to be conducted in the fifth group of buildings "for the application of design to industries," is ambitious in its purpose and unique in its scope. It will aim particularly to develop special talents along original lines.

The sixth and last group is to be devoted to heat, light and power service exclusively. The program prepared by the committee for the guidance of the architects in the preparation of plans, calls for approximately 600 rooms, with a total floor area of 592,000 square feet.

The leading architects of America have entered the competition and will submit plans for the various groups of buildings to the committee not later than September 10th. The award will be made as soon thereafter as possible, as it is desired to have the buildings ready for occupancy in the fall of

1905. However, it is the expectation that classes will be opened in many branches long before that time. If suitable quarters can be secured the work of the schools will be well under way this fall.

Canada Wants Its Own Consular Service.

AN esteemed subscriber of THE AMERICAN EXPORTER in Ottawa, Dominion of Canada, sends us the following interesting article regarding the desire of the Dominion for an independent consular service:

"As a step toward independence of Great Britain in the treaty-making power, Mr. Gervais, of Montreal, a leading supporter of the Laurier administration, submitted to the House of Commons before the prorogation of Parliament proposals for the establishment of a British Canadian consular service.

"The present consular service provided by the mother country has proved useless to Canada. It compares unfavorably with that of the United States, France and Germany, except in the Far East, where it is conceded to be without a peer. It has been asserted that England will never agree to give Canada a special consular service, but Mr. Gervais says:

"Let us demand it. This consular service should precede the granting of the right of treaty-making, which has been a subject of discussion for the last four years throughout Canada."

"The idea is that the service should be paid for by Canada and performed by Canadians fitted in high commercial schools and business training, appointed directly by Great Britain or by Canada. Canada's present commercial agents have no status in international law and are not recognized by foreign Powers. Their number is inadequate and their salaries are small.

"Canada, according to Mr. Gervais, does not want anything resembling diplomatic representation, but does want proper consular representation, which is one thing she has never had under British control.

"Canadian appointees would understand the needs of the country abroad better than appointees of British birth, and the service would benefit the empire because it would increase the wealth of the empire, which means benefit to the whole. If Canada is made 'three times stronger, richer and more respected than before, she will have threefold power to help the empire' in time of need.

"In England Mr. Gervais has discovered it is a general complaint of traders that the consular service is unfriendly, or, at best, indifferent to the protection of commercial interests. The information it furnishes is not of the right kind and comes too late.

"Canada's industrial and trading developments are being closely watched and reported by 350 foreign Consuls, of whom 175 are in the employ of the United States, while Canada's trade commissioners are about a score in number. France employs 550 Consuls in all parts of the world, Germany more than 800, and Argentina, Bolivia, Chili, Denmark, Greece, Italy, Mexico, Portugal, Spain and Switzerland over 100 each, yet the commerce of Canada is greater than that of any except the first two.

"The scheme outlined by Mr. Gervais contemplates the publication of an official paper setting forth tariff changes, movements in foreign markets, foreign commercial legislation, port and harbor regulations, and so forth; the establishment of headquarters at Ottawa, where tariffs and business publications and the latest commercial information can be seen, and also commercial museums of foreign manufactured goods at leading industrial centers."

American Pneumatic Tubes Abroad.

AN interesting account was telegraphed from London recently of a novel exhibition given by an American pneumatic tube company that is seeking to introduce its system of tubes into the British capital. The object of the exhibition was to give Englishmen an opportunity of seeing how the system is worked in America.

In order to demonstrate what the system is capable of, such varied matter as a complete suit of clothes, an egg, a live bird and a bottle of liquid refreshment were despatched through 800 feet of pneumatic tubes eight inches in diameter.

The proprietors of this tube system claim that it can carry in one day the whole quantity of mail matter despatched by the London, Paris, Berlin and Vienna tubes in a year and a good deal more besides.

The opinion of experts is that London requires a twelve-inch-tube system, the carriers of which will take three times as much as those used in America. When this is established it is estimated that the tubes will be able to carry 82 per cent. of London's internal parcel and letter traffic in a sixth of the time now given to its transmission, thus rendering the average cost much lower than the present scale.

Enormous Output of Iron Ore.

IN iron ore output the United States led the world in 1903, according to the report of John Birkinbine to the American Geological Survey.

It says that the quantity of iron ore produced in the United States in the year ending December 31, 1903, was 35,019,308 long tons, a decrease of 534,827 long tons from 1902.

The quantity mined in 1903 is, however, the second largest recorded, and is greater than the combined totals for the year 1902 of Germany, Luxemburg and the British Empire, which are the nearest competitors of the United States.

GERMANY AT OUR FAIR.

Exhibit Is a Credit to the Liberal American Policy That Made It Possible.

THE Louisiana Purchase Exposition is an undertaking of which not only the city of St. Louis, but the United States at large, may feel justly proud. It is a credit to the American people that such a vast object lesson of the nation's progress in the arts and sciences, placed side by side with examples of the best work of other countries, should have been made available for the practical education of the thousands who shall have passed through the turnstiles when the Exposition closes in November.

One of the chief causes of the success of the Exposition, from an international standpoint, was the liberality with which space was allotted to foreign countries and the unselfish manner in which they were afforded an opportunity to exhibit their products to the best advantage. This liberality of policy has been met half-way by many foreign countries, greatly to the advantage of the Exposition, and by none of our friends over sea more than by Germany, which has won for itself a place of prominence among the foreign exhibitors at St. Louis. Not only has Germany assembled a marvelously rich and varied collection of exhibits to illustrate her activity in every department of human enterprise, but she has grouped and displayed these with consummate ability and lavish disregard of cost. The old-time method of having a straggling array of show-cases representing the work of individual firms has been resolutely discarded by the German Commissioners. They have taken it as their true mission to exhibit Germany the nation. Collectivity is the secret of Germany's magnificent exhibit at St. Louis, and the lesson is one that will be taken to heart by other nations at any future international exposition.

In each and every World's Fair Palace, the noble pavilions erected by Germany as the distinctive setting for her exhibits attract the eye by the boldness of design, the elaborate yet always artistic decoration, the unity of purpose revealed as the key-note of the display.

By way of example, let us take our stand in the central hall of the German section in the Palace of Varied Industries. We can readily imagine ourselves in the castle of a king—the approach to the vestibules beyond a marble stairway, around us rich tapestries and paintings, statuary, stained glass, costly and artistic furniture—in a word, all the dignified accessories that make us feel we are in some great presence, in some right royal home. And so in all truth we are, for here are enshrined the choicest specimens of Germany's artistic handicrafts.

None can pass through the suites of magnificent rooms, each more wondrously fitted and furnished than the other, without realizing the masterfulness of the German character—the strength that turns even the highest art to practical purposes. No dwelling-place for show this, with tables too fragile to lean upon or chairs too exquisite for use.

The library is a library where a man feels impelled to read or to write, the music-room is a chamber thoroughly in tune with the harmonies of Mendelssohn and Beethoven. Here, again, is another room, the wall decoration of which is exclusively in wood. At first we fancy we are gazing on fine oil paintings—landscapes and seascapes, glimpses of town and river, portraits of men and women, representations of animal life. But soon the wondering thought comes upon us that all these works of art are produced by the natural coloring and graining of thousands of pieces of inlaid woods. Scrutinize this one panel. A lady in ballroom costume is holding a mirror in her hand and arranging her hair. The whole picture is in wood, from the black, coiled tresses to the sweeping folds of the silken dress!

It is, perhaps, by such comparatively little things that the far-reaching genius of the German nation is revealed. We are accustomed to think of Germany rather as a nation of plodding workers or spectacled scientists, wrapped up in their looms or their crucibles. The subtle delicacy of her art—art, be it noted, always with some useful purpose behind it—comes somewhat as a surprise. Elegance and national decadence have been associated ideas in most men's minds from the days of ancient Greece and Rome. Yet here at St. Louis Germany proves to us that the strong and the powerful nation, in her all-essential grip of the great basic industries, need not lose hold of life's daintiest refinements.

We have mentioned only one of Germany's dozen courts at the World's Fair, but the others contain their full share of interest and suggestion. Our foreign readers who go to St. Louis should pay visits to the Palace of Art and to the German Building close by. In the former are gathered together Germany's masterpieces of contemporary painting. In the latter we see everywhere the touch of the Imperial hand, in thought if not in act. For the rooms are filled with treasures from the Emperor's homes—things of interest, of beauty and of value far beyond estimate.

Then the conception of the German Building is itself a gift from the Emperor to the World's Fair, for it was he who suggested this splendid reproduction of his own Castle of Charlottenburg. On the sweeping rim of Art Hill, the noble edifice, its dull, time-weathered dome contrasting well with the white palaces and the sculptured Colonnade of States that are its neighbors, has become one of the most strikingly beautiful and distinctive features of the grand central picture of the Exposition.

Trolley Railroad Conveniences in America.—That American railroad managers are alive to the business wisdom of adopting every improvement that makes for the convenience and comfort of their patrons is shown by the

action taken this month of the Aurora, Elgin & Chicago Railway Company in establishing a dining-car service on its line. The new trolley dining car was put in commission about the middle of last month. While in equipment it rivals similar cars on the big steam railroads, no attempt is made to vie with the elaborate menu of the latter, a service of the light buffet order being offered instead.

American Wine Is Useful as a Food.

BY a splendid exhibit of its wines at the American World's Fair, California is seeking to prove that it can produce as fine and wholesome wine as the old European countries, and the multitude of fair visitors are given an object lesson in the value of wine as food. Wine is offered by California as an argument for temperance. That State has sent its chief of viticulture, Ferdinand A. Hober, to the Fair to take charge of its extensive wine exhibit. As a wine expert he says:

"Wine as a food drink is sure to succeed, but before that happy result can be possible Americans must learn how to eat. A nation that lives on pie, pickles and ice-water needs watching in the matter of drinkables, and if American women would take up the temperance question from the proper standpoint by providing a good, wholesome dinner with a bottle of pure, dry wine, such as claret, in their homes, there would be less activity on the streets after working hours. It has been clearly demonstrated that the nations which make wine and drink largely of their own productions are noted for sobriety. These people use wine with their food, but not between meals, and they are healthy.

"Some Americans are still wedded to the old prejudice that nothing is good to eat or drink or wear that does not bear the impress of a foreign label, but they will learn better in course of time. When a pure, sound, fermented wine becomes the national beverage, intemperance will be the exception and the country will be freed from the prohibition annoyance. California, with an area capable of supporting 100,000,000 people, with nearly every acre of its productive soil susceptible of viticulture, will not only become the vineyard of America, but will replace the wornout, phylloxera-stricken vineyards of Europe and American wines will be sought and appreciated all over the world."

Exhibition of Vehicles at St. Louis.

ONE of the exhibits that is of most general interest in the Exposition at St. Louis is the magnificent display of vehicles of all types in the Palace of Transportation. This display, though not as large as certain other exhibitions of like character, embraces practically everything in the vehicle line and holds much that is of interest to the country dealers.

Here, also, much time and money have been spent in decoration features and in providing an environment in harmony with the beauty and tastefulness of the articles displayed. In this department the attendance of interested persons has, naturally, been very large, for who is not interested in a handsome vehicle, and many sales and profitable contracts are said to have been consummated. In the Palace of Transportation is, also, a display of automobiles, a great attraction to dealers who have taken up the sale of these vehicles. This is the largest and most comprehensive display of horseless vehicles ever shown at an exposition of this character, and it is doubtful if any of the automobile shows has presented a greater array.

Liquid Hydrogen Produced at World's Fair.

IN the northeastern corner of the Exposition grounds at St. Louis, U. S. A., a building has been erected in which the first demonstrations of the manufacture of liquid air and liquid hydrogen at the low temperature exhibit of the British Royal Commission have been successfully carried out under the direction of J. E. Petavel. The plant is now in working order and is being tested thoroughly. Already liquid air and liquid hydrogen have been produced there. The manufacture of liquid hydrogen is one of the latest achievements of science. A series of lectures on this and other subjects connected with extreme low temperatures are given in the lecture room of the Palace of Liberal Arts, the entire exhibit being a part of the Liberal Arts Department of the Exposition.

These lectures are illustrated with a number of demonstrations with liquid air and liquid hydrogen.

American Furniture the Best in the World.

AMERICAN furniture is superior on account of the technical skill employed in its mechanical execution, and, although we have no distinctive national style, American designers produce some of the best examples of the "period" styles—such as those of the eighteenth century—now in vogue in every civilized country. Furniture of this type made in Europe falls apart in this climate and in our overheated houses. Indeed, dealers have to make over the pieces they import. But a fine piece of furniture of American design and American manufacture in one of these styles combines delicacy and strength to a remarkable degree. American manufacturers even find sale for their products abroad. A Philadelphia house sells furniture to members of the German nobility, and once filled a large order for the Sultan of Morocco, after his agents had examined the product of other countries. Several New York firms make furniture in the French style for customers in Paris.—*World's Work.*

MICHAEL'S LAWN SPECIALTIES

Have been on the market over 46 years,
and have successfully stood the test of time.

Our Motto Is: QUALITY in Every Instance.

New Michael Lawn Swing.

For grace, solidity and beauty the New Michael Four-Passenger Adult Lawn Swing has no equal. All parts are bolted or screwed. We use no nails except in chair slats. No tools required in setting up. We guarantee the New Michael Four-Passenger Adult Lawn Swing to be the best made. Opens and closes like a jack-knife. Contains about 20 cubic feet each, and weighs, each, 150 lbs.

Price, per half dozen \$30.50

Michael's Folding Rocker.

Is the neatest and best article ever placed before the people. Folds as shown in cut. Painted red or green, or natural wood finish.

Six Folding Rockers, crated, containing about 14 cubic feet; weight, 48 lbs.

Price, per dozen \$9.00

Michael's Lawn Settees and Folding Chairs.

Our Lawn Settees and Folding Chairs are the most practical ever placed upon the market. The curve in back is exactly right. Painted red or green, or natural hardwood finish. Six 5-foot Settees, crated, containing about 25 cubic feet; weight, 96 lbs.

Price, per dozen \$18.00

Six Folding Chairs, crated containing about 14 cubic feet; weight, 30 lbs.

Price, per dozen \$6.00

NOTE.—The prices above quoted are f. o. b. New York City.

We also make the Michael Porch and Lawn Reclining Chair.

C. H. MICHAEL MFG. COMPANY,

Cable Address, "Michael." Western Union Code.

LA PORTE, INDIANA, U. S. A.

NEW CUTTER GRINDER

Designed expressly for sharpening all styles of Milling Cutters and Reamers without using Special Attachments. No vibration when grinding the heaviest cutters.

WRITE FOR CIRCULAR.

Visit our Exhibit, Block 13, Machinery Hall, World's Fair, St. Louis, Mo.

ELECTRICITY'S MYSTERIES.

Skilled Engineers, Working to Adapt It to Commercial Uses, Know Not the Secret.

THAT electrical engineers in America are, with skill and ingenuity, meeting the requirements needed to bring the electric steed more and more to subjection to the will of its human master all who keep pace with the rapidly succeeding improvements in their line will readily admit. A recent writer, however, in a very untechnical article, puts his finger in a very untechnical way upon the sore spot that has ruffled the peace of mind of all the greatest thinkers in the electrical world—the mystery of the nature of the current. "They can evoke the giant," he says, "can direct its energy into a hundred channels, can control it with masterpieces of scientific and mechanical achievement, can destroy it. But what it is remains unsolved. It is still the great unknown."

The same writer traces in an interesting manner the development of the utilitarian phase of electricity. "The principle involved in producing the current and adapting its energy to driving machinery and cars and of creating light is simple," he says, "but, why the chemical bath produces the electric current, what the current is and how it instantly transforms the iron into a magnet are mysteries which not even Faraday, Edison or Thomson have attempted to explain."

"For many years efforts were made to obtain motion and power from electromagnets of large size arranged in groups, similarly to the spokes of a wheel, to revolve rapidly past each other; but it was not until the discovery that the battery could be entirely eliminated that the possibilities of electricity as a factor in the great industrial world appeared."

"Some time in the sixties Professor Henry saw his little son playing with a discarded electro-magnetic machine, without battery or chemicals and was led to the discovery of the true generator, and the dawn of the electrical age, with all its marvelous wealth of scientific and commercial exploitation and success, opened."

"Crude and clumsy apparatus was quickly designed and built, and, on being belted to a steam engine, gave an amount of current which no instrument then in use could measure. These early generators were called dynamos and were used exclusively to produce arc lights. A few years later the discovery was made that if a duplicate generator was carried to any desired distance and connected by wires to the first a corresponding rotation was obtained. The current generated in the first machine went over the wire to the second machine and operated it. This was another surprise."

"That its value was instantly appreciated is shown by the fact that in Cleveland, U. S. A., in 1884, without waiting to build new machines, two Brush arc light dynamos which had done service for several years were obtained. One was connected to an engine in a convenient building, the other was attached to the axle of an old horse-car. A wire was strung along the track and the first electric car was commercially introduced, and electric traction and electric power were before a wondering world."

Problem of Distributing Electricity.

A RECENT issue of *Cassier's Magazine* was devoted entirely to electric power. Much valuable information was given concerning the systems for the distribution of power in America and other countries. It was long ago established that the distance to which electricity could be sent economically depended mainly upon the voltage or pressure employed. The higher this is, the further the current will go and the smaller will be the "line losses" with a conductor of a given size. At present there are two transmission lines in America on which 55,000 volts are used successfully. One, 65 miles long, is in Montana. The other, 80 miles in length, is in Canada. Some of the great transmission systems in California are equipped with three sets of transformers, one capable of raising the pressure to 60,000 volts, and the others working at a lower voltage. For reasons which are not given, the maximum pressure has not thus far been adopted on the Pacific Coast, but it is said that a Mexican line 101 miles long has begun to work at 60,000 volts. The difficulties of insulation are so great that anything higher may not be witnessed soon. However, further advances are probable. Speaking of a plan to transmit electric power from the Alps to Paris, a distance of 300 miles, Paul M. Lincoln says that it is not feasible to-day, but the feat may yet be attempted, when pressures that are "within the bounds of reason" may be safely handled.

Other improvements bearing on transmission have been effected in the last few years. Some of these relate to the dynamo, but that machine is now so nearly perfect that a better one is scarcely possible. Great gains have been made in insulation, as has already been pointed out, and also in line construction. A trifling change in the arrangement of the three conducting cables of a system like that between Niagara and Buffalo, in America, has materially diminished the opportunity for mischievous interference by the small boy. Success in the distribution of electricity has been still further promoted by the increased capacity of switches.

A movement of much significance in England is the application for charters for generating plants big enough to furnish current to a number of adjacent communities. Something of the sort is already accomplished in America, where the source of power is water. The British idea is to use coal. The relative cost of hydraulic and steam power varies with locality. In some places one will be cheaper, and in some the other. Whatever be the means

employed to drive the dynamo, though, wholesale production is less expensive than manufacturing on a small scale. It has been estimated, for instance, that if a plant be established which would be able to supply all the towns within a radius of fifty miles, only one-third as much fuel would be needed as would be consumed if each community had its own lighting and power station.

This is not all. Concentration would effect still another economy. Mr. Stillwell, electrical engineer for the New York Rapid Transit Commission, says that a central station having a capacity of only 50,000 horse-power would rarely fail to do the work previously performed by separate plants whose output mounted to 75,000 horse-power, and that the difference might be even greater. In equipping isolated stations it is customary to provide machinery that will meet the maximum demand made upon it. The load usually varies between wide limits in the course of a day. Hence, by substituting one plant for the many, the total consumption would become more regular, and the maximum would never rise far above the average, especially if the uses to which the current was put were dissimilar.

Wireless Telegraphy in Clock Timing.

THE suggestion emanating from Mr. Nikola Tesla many months ago that any number of clocks might be operated synchronously over a large area by the distribution of energy through space by means of magnetic waves appears to have been acted upon successfully by M. G. Bigourdan, who communicated the result of his experiments to the French academy in a paper which was reprinted by several American scientific journals.

Of course, the idea of the electrical distribution of time is not a new one. In Europe as well as in America standard time is transmitted from the official observatories by means of master clocks fitted with electro-magnetic devices and connected by wires to receiving instruments in various cities. In the United States this method of synchronizing clocks is also used in large manufacturing establishments, in connection with mechanical time-recording devices for workmen, this preventing any suspicion of irregularities or tampering with the mechanical timekeepers in the different departments. The applicability of space telegraphy for this purpose extends its scope immensely, and since the object is attained simply by the transmission of uniform impulses, it is really one of the simplest applications of the method which can well be imagined.

In M. Bigourdan's experiments as described by him a master clock was arranged to make and break an electrical contact every second. This operated a relay, which in turn discharged current into the primary circuit of an induction coil provided with an oscillator. The secondary circuit of the coil thus gave an oscillating discharge of very brief duration at regular intervals of one second. The two poles of the coil were connected, one with the earth and the other with an antenna of several meters in height, and by this means the electric waves acted upon a number of receivers, these latter beating regularly at intervals of one second in accordance with the action of the master clock.

Two forms of receivers were employed, one being simply a radio-telephone of the Popoff-Ducrotet system, in which the seconds beaten by the master clock were very clearly heard. The other form of receiver was similar to that of a space telegraph system, the Morse receiver being replaced by a recording chronograph with pen and traveling strip of paper. These operated in a very satisfactory manner, and with the paper moving at the rate of one centimeter per second the time could be recorded with a precision of 0.02 to 0.03 second.

Although the apparatus employed by M. Bigourdan in his experiments was very modest in its proportions, it gave excellent results over distances of two kilometers, and would doubtless have served for greater distances had opportunity offered to install the receivers. There appears to be no doubt that such a device as it was would answer perfectly for the electric distribution of accurate time over the entire area of large cities.

Carrying a House Over a Hill.

PERHAPS it was not so remarkable after all, considering where it happened, but the story told in *Popular Mechanics* about raising a brick building 180 feet on the side of a hill is interesting: "A three-story brick house weighing hundreds of tons, successfully climbed a steep bluff 160 feet high at Kansas City (U. S. A.) without cracking a pane of glass. Upon reaching the top the house was rolled along 300 feet to its destination. It had been built some years ago in a location which was no longer desirable for residence purposes. It was a case of tearing the house down or moving it. The house was carried on a strong framework of timbers, and raised by the turning of 300 jacks divided into 30 groups of from eight to twelve each, from three to five groups being located under each sill. At a signal given by blowing a whistle, one man started at the end of each group and gave each jack in succession one-half turn. After all the groups had been turned another signal was given and the men returned to the starting points, screwing each jack another half-turn and so on back and forth, simultaneously, screwing the jacks so as to raise the building uniformly about one-half inch at each round trip."

The Jeffrey Manufacturing Company, Columbus, O., U. S. A., has just issued a beautifully illustrated catalogue of its grab buckets, employed in loading and unloading ore, lump coal, broken stone, etc., also for excavating clay, gravel and soft dirt. A copy of this catalogue will be sent free to any of our readers who may be sufficiently interested to write for the same.

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and
mercantile institutions of America, and are exclusively employed
by the United States Government.

The machine is a marvel of simplicity, being but six inches
square and weighing only ten pounds, boxed ready for shipment.
One movement of the lever indents the limiting line upon any
preferred part of the check (see reduced facsimile of check) and
by its system of compound levers forces an especially prepared
indelible ink into the fiber of the paper, making it a part of the
document itself and rendering its removal impossible.

The Protectograph is made to conform to the monetary standard of all countries
and to print in any language. The price is \$30, delivered New York City.

WORCESTER, MASS., U. S. A.

AUTOMATIC TELEPHONY.

Invention That Combines Telephone and Phonograph for Ordinary Use.

THREE important inventions, or, rather, one invention with two important auxiliary applications recently reported, are deeply interesting the scientific bureaus of the big American telephone companies. If all that is claimed for them be true the telephone service of the world will receive a tremendous impetus and its value be immensely increased. By means of this new addition to telephony, which is credited to a Dane name Paulsen, it may be said that a telephone talks of itself. In other words, it will save a message that comes in your absence and repeat it to you on your return.

By far the most important of the three inventions is the telegraphone. A telephone subscriber wishes to leave his office for a time yet is anxious that he shall not miss any messages which may come while he is gone. He switches the telegraphone to the telephone, and on his return looks at a dial on the former contrivance.

There is an indicator on the dial, and if this has moved he knows at once that some one has called him up. He sets it in motion and it repeats the message, word for word, as clearly and distinctly as it was originally uttered. The derivation of the word "telegraphone" is thus made clear.

For long-distance messages—for a newspaper, for instance—this apparatus should, it is argued, be invaluable. Instead of a shorthand writer having to take the message more or less slowly, it can be recorded by the telegraphone and be repeated by it at any speed desired any number of times.

It is also possible for a person to sit beside a telephone with the ordinary receiver at his ear and take the message at the same time it is going into the telegraphone. Thus he is able to make sure that the message is clear and distinct. If it is not so he can ring up the central office and stop further transmission until the defect is removed and an unobstructed line provided.

Curiously enough, however, the message reproduced by the telegraphone is clearer and more distinct than the original. An experiment was recently made with words spoken in English by a foreigner. Over an ordinary telephone his accent made understanding difficult. Over the new instrument every word was clear. This is doubtless caused by the sharp metallic tone in which the instrument speaks.

The second apparatus, the disk telegraphone, is another application of the original invention. It is a recording instrument, but is not used in connection with the telephone. It is merely a registering apparatus, like a gramophone. Nevertheless, it might be of immense utility to a newspaper correspondent when the saving of time and the necessity for secrecy are important.

Imagine, for instance, a war correspondent at the seat of action. He takes with him his telegraphone. It is contained in a box which can be easily carried in the hand or strapped to the saddle. During the progress of the battle he speaks a description of the scene passing before him into it. When finished he makes the disk repeat the message to assure himself that all is correctly recorded, unscrews the disk, which is a thin steel plate three inches in diameter, places it in an envelope and sends it to his paper.

When the disk it received at the office of the paper there is not even any necessity for the message being written out. It can be placed in a telegraphone and the latter set alongside the linotype operator, and it will dictate the story to him at any speed desired. The fact that the steel plate bears no signs of any sort insures complete secrecy. As soon as the plate has delivered its message it is demagnetized and is again ready for use.

The telephone newspaper is an apparatus by which the same message can be forwarded simultaneously from one telephone to fifty or even a thousand centers. Suppose, for example, a newspaper syndicates its war news and has to distribute it to a dozen different newspapers. As soon as a dispatch arrives it rings up all the subscribing papers and sends the news through in a single message, instead of ringing up and ringing off a dozen times and repeating the message afresh every time.

Telephones at American Street Corners.

IN some of the more progressive cities in America, telephones available for use by the general public, and placed at street corners either on the telephone pole or on the same post with the United States mail box, are among the conveniences demanded by the requirements of modern life in this country. Keyless stations opened by merely turning a handle and which contain the pay slot and a directory are all the equipment needed, hollow iron posts admitting the necessary wires.

In some places the agreement with the company insures that, for the privilege of placing the telephones, all emergency calls, such as police, fire department and hospitals, may be free of charge. This makes the system a public benefaction, saving time in case of fire or accident, and to an extent protecting the citizen. These stations are paying investments to telephone companies, as they require little extra wiring and cost little to maintain.

George A. Long, in the *American Telephone Journal*, says there is no reason why these stations should not supersede the so-called police telephone systems now in use. Police could send in their reports to headquarters over the public stations and the police box would no longer be needed.

Such a system in residential sections of cities, where in use, has proved to be of great public benefit, as it would in parks and along boulevards and roads frequented by pleasure-seekers. How often the automobilist would find it of use! How often it would save some person from going long distances to the drug store or grocery!

Use of Telephones in America.

IN a discussion on the comparative use of the telephone in America as compared with Great Britain, Mr. Herbert L. Webb, an Englishman, contributes some interesting views to a recent number of *Cassier's Magazine* (New York). He states that New York and suburbs, Boston and Chicago, where there are 325,000 telephones in use, together have an aggregate population less than that of greater London, while they have in use a somewhat greater number of telephones than the whole of Great Britain and Ireland. Mr. Webb is much surprised at the rapid rate with which the use of the telephone is being extended, but is even more surprised that there is no apparent slackening in the rate of development.

To explain this, the most important reason given is that there is no government monopoly of telephones in America. The telephone has here consequently escaped the blight of official interference, which has restricted its development in every European country.

The author thinks that the telephone service in American cities as a general rule is excellent. The answer to a call is quick, and the work of completing the desired connection is rapidly and accurately performed. One important factor in the development of the telephone, he says, has been a policy which is distinguished by two main features—first, to bring the service to as high a pitch of perfection as possible; second, by means of educating the public to the use of the service, and by making rates calculated to appeal to all classes of the community, to create a demand for service so widespread as to be practically universal. One of the important factors in the first of these has been the general adoption of the central energy system. In the other, the adoption of the message rate instead of the flat rate has been the most important influence. In fact, it is since this method of charging was adopted by the New York company that the remarkable development began.

Languages Taught by Phonograph.

WHEN the phonograph was first invented it was suggested that it would revolutionize the teaching of languages. This prediction cannot be said to have approached verification until quite recently. Visitors to the American Exposition at St. Louis, however, have been afforded an opportunity to witness lessons in languages by the phonograph, which are given in the school in the Model street.

All of the obstacles that barred the phonograph from this field of usefulness have been removed, it is claimed. Now the instrument does its duty as a language instructor with the utmost precision. This system has made the success of a correspondence school, has been introduced into several colleges, and several learned professors have expressed their belief in its practicability and value.

The fundamental idea is first to familiarize the ear with the pronunciation of the language one desires to learn. A professor with an impeccable pronunciation has spoken into the instrument, which has recorded certain sentences. Printed on a board placed beside the apparatus are the phrases side by side with their English equivalent. The entire list is gone through very deliberately by the phonograph, each word being enunciated with great distinctness. When the ear becomes accustomed to the strong sounds, the speed is accelerated until finally the words are spoken as rapidly as in ordinary conversation.

Four languages—English, French, Spanish and German—are taught by phonograph at the American World's Fair. In each language 9,000 words accompany each course—a comprehensive vocabulary. Thirty conversational lessons for words in ordinary use are provided.

Ideal Shallow Water Craft.

TO Edward O'Donnell, municipal engineer of a small city in Minnesota, U. S. A., belongs the credit of solving a problem that has puzzled many a boat builder. Mr. O'Donnell has built, launched and successfully navigated on the river that flows through his city a unique gasoline launch. His was the difficult task of making a boat that would meet varying conditions, the most serious trouble being that during the summer the river dries up until in many places there is scarcely a foot of water on the bars.

The usual screw propeller requires two feet of water to run and a stern paddle wheel did not suit Mr. O'Donnell's ideas. He overcame the difficulties by placing behind the boat a regular battery of seven six-inch propellers, which will work in eight inches of water and drive the boat upstream at a speed of twelve miles an hour. Rods of steel projecting backward from the bottom of the boat, under the propellers, keep them from striking snags. The boat will run over a floating log without any difficulty.

By placing the craft on a steel frame supplied with automobile wheels and gearing the boat is converted into a serviceable touring car.

Minnesota is not the only place where rivers run dry in summer, and it is quite conceivable that Mr. O'Donnell may find a field for the exploitation of his invention.

The B. F. Sturtevant Company, of Hyde Park, Mass., U. S. A., have recently published a new catalogue of their Economizers. It contains full details of the Sturtevant Standard and Pony Economizers, their comparative merits, the advantages they afford, their various sizes, weights, accessibility for repairing, etc. This catalogue also deals with the subject of both mechanical and natural drafts, and must be of interest to all steam users. Copies of the same will be sent free to our readers who write for them.

A GREAT IMPLEMENT SHOW.

Fine Display of Cultivating Machinery on View at the American World's Fair.

IN accordance with the avowed purpose of the management of the American World's Fair to assign to agriculture a leading place at the Exposition held in celebration of the one hundredth anniversary of the Louisiana purchase, that gave to the United States 1,000,000 square miles of rich agricultural land, the building apportioned to agricultural exhibits is the largest on the grounds. In fact, it is the largest building ever erected for exhibition purposes. That the applications from intending exhibitors aggregated double the 500,000 square feet available for exhibition purposes in this huge structure is a striking demonstration of the important place agriculture occupies among the industries of the United States.

To the makers of agricultural machinery about one-fifth of the space in this huge building was allotted. They would gladly have filled and used twice or three times as much area. However, the implement manufacturers of the United States are to be congratulated on the excellent use they have made of the opportunity afforded them. Even if the display had been larger it could scarcely have been more representative in so far as the quality and variety of the implements exhibited are concerned, and, as it is, it is very doubtful whether so great and so attractive a collection of agricultural implements will ever again be gathered under one roof during the present generation.

No better situation could have been chosen than that assigned to the display of implements in the huge Palace of Agriculture. One end of the building is given up to the exhibition which is indeed a representative showing of farm machinery and utensils of every description and a magnificent advertisement of the high plane of perfection to which American manufacturers in this line have attained.

No implement employed in tilling the soil, seeding, planting, harvesting and preparing crops for the market is missing, and in and near the Palace of Agriculture are also to be seen wind-mills, dairy machinery, and the various utensils which relieve the burden of the household work on the farm, machines which progressive dealers the world over are now handling with as much profit as they derive from their business in plows, cultivators and harrows. No person engaged even remotely in agriculture can fail to be interested in the exhibit.

Men who have been schooled in the manufacture and actual operation of machines and who possess the ability to explain, not only the mechanism of the various implements and the principles on which they are constructed, but to show wherein labor is saved, durability insured and the yield of crops greatly enhanced by the use of these tools have charge of the exhibits. Time spent with these experts will be valuable to any visitor, for he cannot help but learn new points of interest whether his interest be that of a dealer or a buyer. Thus far many of the visitors directly interested in farm machinery have been from abroad, and among these keen interest has been manifested. The labor problem in many foreign countries is becoming serious and the farmers realize that the time has come when they must employ labor-saving farm implements to a greater extent than formerly. If this exhibition accomplishes nothing else it will probably be the means of extending the American implement trade in parts of the world not yet reached by our enterprising manufacturers. It is stated that some new and important contracts have already been made and other deals are being negotiated.

Closely allied to the exhibition in the Palace of Agriculture are those in the Palaces of Transportation and Machinery and in the three buildings, dealer, jobber, manufacturer, salesman and buyer will find large and comprehensive displays of the things which interest them and, it may be added parenthetically, some things which should, but have not yet found their true representation in the retail field at large. Here the agricultural implement, the farm utensil, the various labor-saving, profit-earning devices for the agricultural household; over there the vehicle, no longer a luxury, brought within the means of all, yet lacking nothing of beauty and durability.

Further along may be seen the gasoline engine, that wonderful motor which has solved the problem of power on thousands of farms and is destined to win the universal popularity it so well deserves. Not one of these displays but will inspire in the manufacturer renewed effort to reach the goal of success in trade, none but will educate the buyer and none but will kindle a feeling of satisfaction in all who are factors in the marketing of them.

Desks.—In the manufacture of office furniture, such as roll-top or flat desks, American firms have made wonderful progress and some of the desks offered for sale are really works of utility and art combined. One of these is the Moon Desk Company, of Muskegon, Mich., U. S. A., which has recently issued a catalogue showing just what it has to offer in this line to the export trade. Copies will be sent free on application, to foreign importers.

Sultan Likes American Ships.—So pleased was the Sultan of Turkey with the new Turkish cruiser, *Madjidia*, built in the United States, that he sent a complimentary telegram to President Roosevelt and a personal message to United States Minister Leishman, commending the high qualities of the American shipbuilding industry. The ship was taken to Mytilene, Turkey, by American officers and crew.

American Farm Implements in Spain.

WHILE probably the majority of our readers will agree that war between any two countries is a thing to be deplored, and that the recent contest between Spain and the United States offered no exception to that axiom, it is a source of gratification to learn that even that unfortunate struggle, like most of the ills which humanity is heir to, has turned out to be a not unmixed evil. Recent advices from the United States Consul-General to Spain go to show that one of the results of the war—now that the feeling of mutual bitterness almost inseparable from a state of actual hostilities has subsided—is the establishment of decidedly more friendly commercial relations between the two nations. This has been shown by a gratifying increase in the demand for American products and more especially for farming implements manufactured in this country.

Consul-General Lay has in a late report laid before the Department of Commerce the result of a sort of symposium of an investigation along this line made by the consular agents under his jurisdiction in the several provinces of Spain. Briefly summarized, the report states that while the cost of hand labor is very cheap in all parts of Spain and does not seem to justify the farmers owning very small farms using even the modern plow, on the larger farms agriculturists not only can but do use labor-saving machinery of the most recent types.

In the northwestern and southeastern districts and the country on the northern coast the outlook for selling modern agricultural machinery is not bright, but in the center and in the southwest of Spain the farms are large and offer a virgin field for our agricultural machinery. Until 1900 modern machinery was practically unknown in Spain, and reports from all parts of the agricultural districts show the larger farmers and experimental farms are all commencing to use modern machinery.

As an illustration of the progressive Spaniard's readiness to adopt modern ideas, when shown their practicability, Mr. Lay cites the fact that two years ago a Spanish company constructed a cement mill, situated south of the Spanish Pyrenees, and in order to carry the American machinery to equip this mill from the nearest railway station to the works purchased a locomobile from California. A timber-limit owner having seen this locomobile in operation, realizes its advantages over mule power and is now negotiating for the purchase of several American locomobiles.

The following extract from a letter to Mr. Lay from a practical agriculturist in the district of Valladolid, who has a farm of 6,990 acres, is one of the most interesting items in the report:

"From the United States I have three 5-foot binders and seven 6-foot binders, some cultivators, some weeders and harrows, five wheat-sowers, potato sorter and digger, a thrashing and straw-cutting machine and a 12-nominal-horse-power locomobile, besides many other machines which I purchased through advertisements. The implements having the largest sale and use here are American, English, German and French plows, American and German machines for sowing cereals (mostly American) and American harvesting machines.

"American agricultural implements give satisfaction and good results and trade could be increased if the implements were cheaper. I do not mean by the manufacturers, but by the sellers here; between the exchange, the duties, freight and the large profits of the seller, the implements cost so much that there are few who can pay the prices."

The consular agent at Santander, in Castile, a province that is in greater part devoted to the production of wheat, speaks very highly of American implements. He says that reversible plows, especially those working superficially, mechanical sowers, reapers, rakes and winnowing ventilators are the implements in most general use. "In general," he asserts, "agriculturists having made practical experiments prefer American implements. The agriculturists, noting that American machinery is better fitted for the uses for which it was intended, give it the preference, as it requires less power to work it—a most decisive reason in a country that is forced to rely on animal power."

The most practical means, this agent believes, to increase the sale of American implements is the establishment of agencies with permanent exhibitions of the machines and implements affording visitors a practical illustration of their working and the advantages to be gained by their use.

A Factory Utopia in America.

THAT kind, thoughtful treatment of employees is a paying investment is thoroughly believed in by the managers of one large American factory.

They are especially considerate of their female workers. The company has special cars that stop at the factory gate in the evening at quitting time to carry the women to their homes. Then, in order that the 500 women employed may not be lost in the crowd of 3,000 men employed in the factory, the women stop work fifteen minutes before the men's whistle blows.

A recess of ten minutes in the forenoon and again in the afternoon is allowed to all the women. During these periods calisthenics are practiced.

Dining rooms fitted up especially for the employees are provided. For the sum of 5 cents the women can obtain a good, healthful luncheon. In the men's dining room the lunch is somewhat more elaborate and the price is 12 cents.

The factory is also fitted up with bathrooms where the working people may bathe in the company's time.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 1/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

SIX-SECTION CASE.

Showing a six-section case with top and base set up, and the same case boxed K. D. ready for shipment; weighing 200 lbs. gross, 150 lbs. net, and of 10 cubic feet, thus securing a low freight rate, occupying but little space in warehouses and on shipboard.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dower-plugs; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

Modern vs. Ancient Threshing.

AN interesting testimonial to the advantages of threshing grain with a modern American outfit as compared with the threshing methods of the Patriarchs and which, until recently, were the only ones in use in the Island of Cyprus, is furnished in a recent letter from one of the leading agriculturists of the island to its Governmental Director of Agriculture.

The Board of Agriculture of Cyprus has for some years been desirous to introduce into the island the use of American threshing machines. Mr. Gennadius, the director of agriculture, has taken up the subject and overcome the special difficulties which presented themselves in consequence of its being necessary when threshing the grain to prepare the straw in such a manner as to make it immediately available as fodder for stock. Thanks to his exertions and special skill, a machine has been produced, after much trouble and many experiments, which, during the last year, proved entirely successful both in separating all the grain, and grading it at the same time into the different qualities, and in "chopping" or preparing the straw for fodder. These results are obtained at one operation.

After summing up the multitudinous disadvantages of the old system by the statement that it involves a total loss of the grain amounting to 10 per cent., the Right Rev. the Abbott of Kykko, the correspondent above alluded to, goes on to say:

"Last year having threshed our cereals by the Government machine we avoided the above risks and losses and we obtained the following benefits:

"We gained four entire months' time which we devoted to plowing up our fields. Having thus prepared our fields early we succeeded in sowing for this year 200 donums of land more than we usually do with the same number of teams.

"The surplus of our cereals was sold quickly and for a much higher price than that of the market, because our grain, being cleaner, was preferred by the purchasers.

"The quantity of cereals stored for our own use was and is still kept without being attacked by the weevil.

"The stored straw is of far greater quantity and of better quality.

"The front sieve of the Government threshing machine has the advantage of dividing the straw into two qualities. The first quality forms two-thirds of the whole quantity yielded and is exactly as fine as the straw obtained by the native system of threshing, but cleaner. The other third, which forms the second quality, is somewhat longer than the straw prepared by the native system; however, it is sufficiently soft and proper for feeding purposes. But if it is wanted shorter, it can easily and cheaply be obtained so by rethreshing on the native system. Last year, having tried this rethreshing, we found that all the second-quality straw yielded by the machine in two days can be rethreshed in a day by four pairs of ponies.

"Thanks to the front sieve, not only the straw is divided, but also all grain coming out with the straw is collected and put aside. These grains are the largest and form the tenth part of the whole crop.

"That the American machine will promote not only the farming, but also the breeding of stock in the island, is demonstrated by the following:

"With the surplus of straw obtained by threshing with the machine many cattle may be fed.

"It has been noticed that the cereal husks which by the native system of threshing are totally lost (because they are turned into dust), by the threshing machine are collected and put aside, and are eaten with avidity by sheep and goats. Therefore they may be used as regular food for the flocks during the period of scarcity of other food. We will try this experiment shortly in order to see the result."

Tide Predictor Is an American Marvel.

IN constant operation in the Coast and Geodetic Survey, at Washington (U. S. A.), is a machine that is one of the most wonderful pieces of mechanism in existence. It is the machine which predicts tides. Every year its predictions are issued for the benefit of mariners and the shipping industry, embodied in a volume under the title of "Tide Tables." At least a dozen elements are necessarily known before a tide can be predicted for any station with any degree of accuracy, says the *American Inventor* in discussing the merits of the Tide Predictor in a recent issue. By a process of selection and exclusion the tide is resolved into a number of factors, which are practically constant for that particular station, and by means of which, when known, a somewhat intricate and lengthy process of mathematics can accurately predict the coming tides for an indefinite period in the future. Such predictions, however, are, of course, subject to the error caused by abnormal meteorological conditions, such as storms, hurricanes, etc.

When these data have been obtained, instead of employing a corps of computers, the Coast and Geodetic Survey has recourse to the wonderful tide-predicting machine. It is provided with nineteen dials, taking account of nineteen factors of a tide, and these are set by means of pointers before the machine is operated. Once these dials are set for any station a clerk can turn a small handle to the left of the machine and read off from a dial the times of occurrence of high and low tides for an indefinite period ahead and the depth and height of such tides. This performance is the more wonderful when it is considered that every factor has an influence on every other factor.

Although it would be impossible without illustration to explain intelligently the complicated mechanism of the predictor, and it must be seen and

studied to be appreciated, any one can understand the statement that the machine actually does the work of forty computers, and that it has been doing it since 1883, when the machine was completed at a cost of \$3,500. It was the invention of Prof. William Ferrell, who gave the invention to the United States Government.

Effective as this machine is, however, it is not to be compared for a moment with the one at present being built at the instrument shops of the Coast and Geodetic Survey. The new machine will take account of thirty-nine factors of a tide, instead of nineteen, and will not only give the time of high and low tides, and their depth and height, but will give the state of the tide at any hour of the day or night. The present machine, after being set, is worked by turning a handle; the new machine will be run by clock-work. One of the principal reasons for wanting a new machine is found in the extremely delicate construction of the present mechanism, which allows a slight error of torsion in the shafts to creep into the final result.

The new machine has been building for some years and will hardly be completed for several years more, inasmuch as the force of instrument-makers can only work on it when other demands on their time cease. The regular work of manufacturing and repairing surveying instruments must go on, and the tidal machine must take its chance, getting worked upon in the interims. It is interesting to note that E. G. Fischer, now the chief of the Instrument Division, worked on the original machine. Scarcely less credit must be given the builder of so complicated and intricate a mechanism than to the master mind which invented it, as upon the accuracy and faithfulness of the workmanship depends the accuracy of the predictions, upon the accuracy of which, in turn, depends human life and property. The improvements on the new machine are largely, if not wholly, due to Mr. Fischer's inventive genius.

Germany Pays \$3,400 for Nineteen of Our Chickens.

A NEW price record for fancy poultry has just been established in America, if not in the world, by a New York State fancier. He sold the other-day a flock of nineteen birds—three cocks and sixteen hens—for export to Berlin, Germany, for an aggregate of \$3,400. They were all of the rose-combed Black Minorca breed.

The leader of the flock is the cock Victor, a first-premium winner in several exhibitions, which sold for \$1,000. That the purchaser saw in this individual superlative merits is evinced by the fact that the highest previous price ever paid for a single fowl in America was \$300. Second only to Victor is his brother, Headlight III., winner of seconds to his brother at these exhibitions. For him was obtained \$500. Then came the cock Captain, a first winner as a cockerel, for \$200. The sixteen remaining members of the flock, all females and all winners at the various shows, were lumped in together for \$1,700.

The Black Minorca deservedly holds a high reputation among poultry fanciers as being a prolific layer and profitable bird for the table. In 1887 the owner was led to experiment in the direction of the rose-combed Black Minorca in an attempt to reduce the Black Minorca as nearly as possible to no comb at all. This breed was distinguished by its large comb, which was considered by many as a defect because of its greater susceptibility to freezing weather. The owner started with his own imported strain of Black Minorcas, and the process was a very tedious one. The first start was with a cockerel which was hatched from one of the breeding pens that he imported. He had two side splits on his comb. Only a small percentage of the first generation of his progeny showed the same defect, even in this slight degree. In 1889 the experimenter succeeded in getting but one hen which showed a satisfactory reduction in her comb, and from this individual has been produced the present rose-combed Minorcas.

American City Rises Out of Its Ruins.

NEWs from Galveston, the American city on the Gulf of Mexico that, a little less than four years ago, was to all intents and purposes wiped off the map of the United States, tells us of the completion of a great new sea wall and of preparations to grade the city itself up to the level of safety established on the Gulf side. In three years more, we are told, the city will have been raised above the possibility of a recurrence of the disaster caused by the great tidal wave of September, 1900.

When Galveston shall have been elevated to a position of security from floods the city, which already has won for itself a remarkable reputation for its energy in recovering from disaster and for the commercial pace it has set, will indeed be a place unique. Sea walls have been built in other places and dikes have been strengthened from time to time, but the raising, practically, of a whole city far above high-water mark has no place heretofore in the expression of human enterprise and determination.

There was talk of abandoning the Galveston site for one brief moment of dejection after the disaster of 1900; but despair was succeeded by determination and with the reaction came a veritable boom. One year ago, three years after its apparent desolation, this city of barely 40,000 souls was marked as ranking third among the export ports of the country and eighteenth on the list of ports of entry. Fifty-three steamship lines contribute to a trade which had in September last doubled itself in a year. From these facts it will be seen that the elevation of Galveston is worth while even for more substantial purposes than that of presenting an unrivaled example of municipal pluck.

ANIMAL TRAP CO., ABINGDON, ILLS., U. S. A.

The Largest Manufacturers of
MOUSE, RAT AND GAME TRAPS IN THE WORLD.

Particular attention given to export orders. Illustrated catalogue free, giving full particulars. Order through your Exporter.

"Out o' Sight"
Mouse and Rat Trap,
also Imitations.

"Catch-'Em-Alive"
Mouse Trap.
Delusion Pattern.

"Stop-Thief" Trap,
4 sizes.
For catching small fur-
bearing animals.

Coxes'
Self-Setting Wood
Choker Mouse Trap.
1, 2 and 3 Hole, Square.
4, 5 and 6 Hole, Round.

Coxes'
5-Hole Metal Mouse Trap.
Extra heavy.
Well made.

Pennsylvania
Rat Trap.

LITTLE'S (Gold Seal) CARBON PAPER,
LITTLE'S BRILLIANT RIBBONS,
LITTLE'S COBWEB CARBONS,
LITTLE'S SATIN-FINISH CARBONS.**

"Tried and NOT Found Wanting."

Used and recommended by leading mercantile houses and court reporters in all parts of the world. Send for Catalogue. Orders received through any New York exporting house at export rates.

A. P. LITTLE, Rochester, N.Y., U.S.A.

Manufacturer Standard Typewriter Supplies.

ESTABLISHED 1846.

ESTEY ORGAN COMPANY,

Brattleboro, Vermont, U. S. A.

Cable Address: "Estey," Brattleboro, U. S. A.

Builders of **High-Grade Organs and Pianos**

Over three hundred and fifty thousand (350,000) in use throughout the civilized world.

The **Estey Reed and Pipe Organs** are specifically made for use in churches, chapels, music and lecture halls, Masonic lodges, schools and residences.

The **Estey Pianos** are made in several styles of Upright and Grand. Our Catalogue, illustrating and describing the various styles of Organs and Pianos made by us, mailed postpaid to all parts of the world.

None but the most skilled workmen and the best of material are employed in the making of the **Estey Organs and Pianos**. Prices quoted F. O. B. cars at New York City. Specify "Estey," and when ordering, to avoid errors, please mail us a duplicate of order.

NOTE.—To facilitate the handling of our export trade we desire to communicate with one responsible musical instrument dealer in each trade center of the world.

ESTEY PIANO. Style 20.

Made in mahogany, oak and American walnut. $7\frac{1}{2}$ octaves, scale A to C. Height, 4 feet 3 inches; Length, 5 feet; Depth, 2 feet 3 inches; Weight, boxed, 360 pounds.

ESTEY ORGAN. Style "S."

Solid walnut or oak case. Height, 6 feet 8 inches; Breadth, 3 feet 10 inches; Depth, 1 foot 11 inches; Weight, boxed, 400 pounds.

HAVE YOU SEEN THE

**Schroeder
Rotary
Washer?**

It is the most perfect and successful Rotary Washer on the market. The tub is made of red Louisiana cypress, which will not fall apart. All castings are finished with rust-proof aluminum paint; all iron parts coming in contact with the clothes are heavily galvanized. We also make other washers. For particulars address

AMERICAN HOISTING ENGINES.

Excellent Work Done by Our Machines in Foreign Lands and on Ocean Vessels.

NOTHING, perhaps, has done more for the reputation of American machinery abroad than the excellent, and, in many instances, remarkable, work achieved by the hoisting engines built in the United States, and which have come to be regarded as standard by engineers in foreign lands as well as on the great vessels that traverse the waters of the Eastern and Western hemispheres. These reliable, hard-working little machines, each bearing the nameplate of its American maker, are found not only in the mines of Alaska, in the cypress swamps of Florida and Louisiana and in the giant forests of Canada and the Northwest, in our own country, but also on whaling vessels in the Arctic seas, in the diamond fields of South Africa, in the gold diggings of far-off Australia and on the wharves and docks of the world at large.

It would be hard to find anything that conveys the idea of hard, practical, hustling work so emphatically as does the hoisting engine. While one is thumping piles into the mud of the river bed you will find another near at hand operating the scoop or bucket of a steam shovel or dredge. Hoisting engines are indispensable in quarrying, mining, loading and unloading vessels, digging sewer ditches and canals, building bridges and tall buildings and for a hundred other purposes. No steamship is complete without one or more of them, and on sailing vessels they are used for hoisting sail, warping the vessels to their berths at wharves or in docks, raising the anchors, and for loading and discharging cargoes.

And yet the hoisting engine is of comparatively modern origin. The business of manufacturing them in this country was begun about 1845, when they were generally spoken of as donkey engines, probably because they took the place of mules and horses in the work of pulley-hauling.

No city in America is more closely identified with the progress of the hoisting engine than is Newark, where there is a tradition that the first and second engine of this type, then called a winch engine, was made in this city as early as 1826 or 1827, but there is not sufficient evidence to back the story up. It was not until 1845 that any machinist in this country devoted his whole attention to making hoisting engines.

In that year the Lidgerwood Manufacturing Company was founded. If the plans of this company are carried out the American city of Newark, N. J., will produce at least 90 per cent. of all of the hoisting engines in the world. At present that city is doing pretty well toward this end. The Lidgerwood Company is probably the largest manufacturer in the world at present, with the Lambert Hoisting Engine Company second, and J. S. Mundy a close third.

In one of these great factories are manufactured not only hoisting engines of over fifty types, but fixed and portable derricks, coal towers, loading and unloading machinery, mine engines, sheaves, buckets, pulleys, piledriving hammers, winch shafts, dedging machinery and all kinds of fixtures used in hoisting work. A specialty of this concern is electrically driven hoisting engines with motor and controllers upon the frames.

One peculiarity of a hoisting engine is that it looks cheap and yet costs more per pound than the most improved type of Corliss or other stationary engine. You can buy hoisting engines rated from five horse-power up to 250 horse-power, and the latter will cost you more than a handsomely finished, high-speed or compound engine of the same capacity. Hoisting engines are not made for show. Strength, utility and endurance are the features sought for, and, above all, simplicity is demanded. The common, or standard, type of hoisting engine used upon bridge work, steel construction, sewer work or quarrying, seldom has a roof over it. There is no demand for polished steel, or fancy fittings upon an engine which is designed to do dirty work in storm or sunshine. All the contractor wants is an engine that will stand up to its work and will not require an engineer to know any more than to run it and obey signals.

One of the great advantages of the hoisting engine is that it can get about with very little help. It is self-propelling, with or without wheels. At the engineer has to do is find something to snub a rope to and he can yank his engine along on skids. If he has the right kind of an engine for bridge construction, with a number of drums or winches upon it, he can start his engine and elevate it with ropes and ride up with it, stopping in mid-air if he chooses. Of course, he has to have something above to tie the cables to. When the bridge over the Hudson River at Poughkeepsie, U. S. A., was being constructed, a hoisting engine was sent up the Hudson River on a boat. It was stopped under the bridge and ropes let down from the structure and passed around the winches. The engineer and four men stood upon the engine bed, and when the power was turned on the engine raised itself to the point on a pier where it was needed. This needed clever manipulation, as the engine had to be not only hoisted by its own power, but warped over to its bed after reaching the desired point.

In the Canadian woods wonderful logging boats called "alligators" are used. They contain a hoisting engine and a portable sawmill. The owners plunge through forests from lake to lake with these strange craft, and the locomotion is all done with the hoisting machine. The boat is drawn out of water by means of cables attached to trees or stumps, and a way is opened for it by axmen. It puffs and wheezes as its heavily planked bottom is drawn over stumps, up hills, through swamps and slanks to the destination selected by the owner.

The furnace is fed with wood from the deadfalls and with sawdust and slabwood after the mill gets to work. Most of the "alligators" are put down as pirate craft, and are held in terror by the dwellers of the woods. It is said that a few years ago a man with a hoisting engine in his boat made a record of five and one-half miles in a day through a trackless pine forest between two lakes.

Mechanical Devices That Seem to Have Brains.

A WRITER in a recent issue of the *Washington Star* relates some interesting observations regarding the progress made by American ingenuity:

"From the corn-miller's little bell that sets up a fussy tinkling the moment the hopper runs empty, up to the calculating machines that are now to be found in banks and insurance offices, clearing-houses and observatories, there are so many mechanical substitutes for brain-workers that it is difficult at times to realize that it is, after all, only mechanism and not intelligence that is being evolved," said an employee at the patent office to the writer. "Some of the touches of what, for convenience, we may call mechanical intelligence to be met with in various odd corners of the industrial and commercial world are really quite amusing, and they have their prototype in that little bell of the old windmill.

"There is, for instance, to be seen in any screw factory, a different application of that device. The machinery takes hold of a rod of metal, pulls it rapidly along, gives the end of it the general shape of a screw, cuts the thread round it and the slot in the head, and then ships off a perfect screw. If you watch the thing actually making the screws the idea strikes you that it is really a piece of mechanism; but when the machine comes to the end of its material and gives a sharp, impatient ring of the bell for the attendant to bring more, you cannot help laughing and you would scarcely be surprised if, when the man came with another rod, the busy screwmaker gave him a sharp reprimand for inattention and dilatoriness. In these days of phonographs, of course, it would be quite practical to make it do so.

"The machine by which railroad tickets are printed gives another amusing little show of intelligence or what looks to be very like it. Railway tickets are not, as might be supposed, printed in large sheets and afterward cut up. The cardboard is cut into tickets first and they are printed one by one afterward. The little blank cards are put in a pile in a kind of perpendicular spout, and the machine slips a bit of metal underneath the bottom of the spout and pushes out the lowest ticket in the pile to be printed and consecutively numbered. It is of no use to print a bad ticket. The machine finds out an imperfect blank in an instant, and flatly refuses to have anything to do with it.

"These are simple instances of a good imitation of watchfulness and discrimination; indeed, the latter looks almost like conscientious care. They afford a droll suggestion of the trained intelligence of the learned pig or the performing dog; and we find many various degrees of the same. At the United States mint they have weighing machines for coins to which it is difficult to deny a very acute intelligence. The mint apparatus is the more remarkable of the two.

"The new coins at the mint, however, are sometimes a trifle over weight, while sometimes, of course, they are under, so it is necessary to sort them out in three categories—light, heavy and good. This delicate business is done with unerring precision by a long row of wonderfully clever machines. Into these machines single piles of shining new coins are put, and quite automatically the mechanism takes each coin, puts it into the scale and in a fraction over two seconds—at the rate of twenty-five a minute—weighs it. If the coin is light the machine shoots it into its proper receptacle; if heavy, into another, and if it is of correct weight, or with a margin as they call it, it is pushed into a third receptacle."

Excavates Seven Cubic Yards a Minute.

THE problem of satisfactorily and economically digging out submerged solid rock has been successfully mastered by an American company which is now engaged in the task of digging a canal or inland harbor at Buffalo, U. S. A.

This canal is to be 200 feet wide and 23 feet deep; that is, its bottom is to be twenty-three feet below the level of the lake, so that in places the excavation is to be forty feet in depth. When the surveys were made it was found that a strip of rock nearly a mile in length, 200 feet wide and ten feet in height must be cut out. The ledge or strip is not shale slate but solid living rock.

The construction company is overcoming this formidable obstacle by the employment of a steam dredge which probably is the biggest tool of its kind in the world. Its anchors, or spuds, are of giant Oregon fir, fifty-three feet long and forty-four inches through. It has a dipper with a capacity of seven cubic yards. One man with a dozen levers before him operates the machine.

The dipper is armed with steel teeth about fifteen inches long and six inches thick. The man at the levers drops the dipper fifteen feet to the rock bottom. Then he moves another lever and the big engine down in the hold gets under way. There is a ripping and tearing and grinding and up comes the dipper with its maw chocked with masses of splintered rock. It can dig up seven yards a minute.

Griffin Cleaner and Paste Combination

for Cleaning and Polishing Russet and Russia Leather Shoes and all Articles made of Russet and Russia Leather.

NOTE—Our Cleaner contains no Camphor.

Our Cleaner and Paste Combination for cleaning and polishing Russet and Russia Leather Shoes (and all articles made of Russet and Russia Leather) cannot be surpassed, if used according to directions.

The Cleaner cleans and removes stains, and the paste produces a brilliant, durable waterproof polish, which is not sticky or gummy. We also make it in different colors, ox blood and brown.

Price per gross, large size.....\$14.00
Price per gross, small size..... 7.50

Discount, 10 per cent.

Griffin Russet Leather Polishing Paste.

Our Russet Leather Paste for producing a high gloss on Russet and Brown Leather Shoes (and all articles made of Russet or Brown Leather) cannot be surpassed, if used according to directions. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and yet is not a varnish.

Excellent for vici kid.

We guarantee it not to injure the leather in the slightest degree, as it is free from acids, and will not soil the finest of fabrics.

If the shoe is dirty it should first be cleaned with Griffin Russet Leather Cleaner.

Price per gross, large size.....\$6.00
Price per gross, small size..... 3.50

Discount, 10 per cent.

Griffin Russet Traveler's Outfit.

An excellent thing to take along when traveling.

Contains a bottle of cleaner for cleaning and removing stains. A box of our polishing paste and a polishing mitten.

Price per gross.....\$18.00
Discount, 10 per cent.

Our Parisian Dressing.

A Black Dressing for Ladies' Shoes. Is considered by good judges to be the best and nicest put-up 10-cent dressing on the market.

We guarantee it not to contain anything injurious to the leather. It contains oil which helps to keep the leather soft and pliable. Packed in one and three dozen boxes.

Price, per gross, \$8.00.
Discount, 10 per cent.

Griffin Sterling Combination

Our Sterling Combination for dressing and producing a gloss on shoes made of Box-Calf, Cordovan, Vici Kid, French Enamel and all fine dry black leathers. Cannot be surpassed if used according to directions. It is easily applied, polishes quickly and easily; its lustre is brilliant, durable and not sticky or gummy and will not crack or scale off. It keeps the finest of leather soft. We guarantee it not to injure the leather in the slightest degree, as it contains no acid or other injurious substances.

A circular in each package giving full directions.

Price per gross, large size.....\$15.00
Price per gross, small size..... 8.00

Discount, 10 per cent.

Griffin Patent Leather Polishing Paste.

Our Patent Leather Paste for restoring the gloss to all articles made of Patent and Enamel Kid Leather cannot be surpassed. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and is not a varnish, as it leaves no coating.

We guarantee it not to injure the leather, as it is free from acids.

It is invaluable for brightening the saddle and blinders of harness, as the polish is waterproof.

Just the thing for manufacturers of harness to use, as it will prevent the Patent Leather parts from becoming dull.

Price per gross, large size.....\$6.00
Price per gross, small size..... 3.50

Discount, 10 per cent.

GRIFFIN SNOW WHITE.

For cleaning and re-whitening white shoes made of canvas, suede and buckskin.

Price, per gross, \$10.00.
Discount, 10 per cent.

NONE BETTER MADE AT ANY PRICE.

Send us a trial order through any commission house in New York; above prices f. o. b. N. Y.

GRIFFIN

High-Grade Shoe Polishes.

GRIFFIN M'F'G CO.,

82 Cortlandt St.,

New York, U. S. A.

Griffin Sterling Traveler's Outfit.

For Box-Calf, Vici Kid, French Enamel and all dry Black Leathers.

Put up in a carton. Contains a bottle of Sterling Dressing, a box of Polishing Paste and polishing mitten. Also suitable for Enamel and Patent Leather.

Price per gross.....\$18.00
Discount, 10 per cent.

VAST PIPE LINES PLANNED.

Colossal Improvements Costing \$200,000,000 That Will Make Standard Oil Independent of Railroads.

IN order that it may meet altered conditions that have arisen in the last few years in the production of crude oil in the United States, the Standard Oil Company, according to a recent article in *Popular Mechanics*, has determined upon and even commenced work on vast improvements in its facilities, the cost of which is estimated at probably \$200,000,000. The colossal plant of the company at Whiting, Ind., the largest oil refinery in the world, is soon to be made of threefold more importance by a great scheme for developing the new Southern and Western oil fields.

The Whiting plant is to be made the radiating point of the oil industry in America. From it pipe lines are to extend in all directions, tapping every oil region in the country. Handling the entire crude oil production of the East, West and South, through underground pipe lines, instead of railroad tank cars, is contemplated in the great development plan. Streams of oil flowing underground through connected pipe lines extending all the way from Port Arthur, Tex., through the oil regions of Oklahoma, Kansas, Indiana, Ohio and the East, to New York City, a distance of more than 2,500 miles, will be the result when the scheme materializes.

From this great "trunk pipe line" branches will extend to all the Standard Oil refineries. This system of underground oil transportation will make the Standard Oil Company entirely independent of the railroads for handling crude oil and will save the company millions of dollars annually in freight expenses. The Whiting plant is practically to become the central plant of a mammoth pumping system that will have streams of oil speeding underground across the continent, from the Gulf of Mexico to New York City.

At present an eight-inch pipe line, reaching to the refinery from Lima, O., 200 miles and fed by wells of the Ohio and Indiana fields, furnishes the crude oil supply of the Whiting plant. There are pumping stations fifty miles apart all along this pipe line, and at each station there are about ten men employed. The cost of transporting the oil through this pipe line is about one-tenth of what it would be if shipped by rail. The line pumps into Whiting each day an amount of oil averaging 300 cars, which is the present capacity of the plant. This capacity is to be greatly increased when the proposed improvements are made and when the great interstate pipe-line system is in operation.

Since 1902 the United States has led the world in the production of petroleum, and the output is still increasing by the constant opening up of new fields. Russia, the nearest competitor to the United States, in its last report shows a decline. In 1902 the United States produced 48 per cent. of the entire petroleum output of the world, and doubtless these figures will be added to when the report for 1903 is issued. The United States produced in 1902 8,266,862 barrels more than Russia and 19,377,722 barrels more than the preceding year's production of the United States. Russia's production showed a decline of 4,628,512 from the preceding year.

For this increase the United States is indebted to the western and southern sections of the country. But for them the output would have fallen far below that of Russia, and, in fact, would have shown a decrease, compared with the production of 1901. All the old Eastern oil fields which have heretofore been the principal source of the Rockefeller millions and of the big American oil production show a falling off, while in the new fields the production has increased enormously.

This would indicate that the United States is destined to supply the world with oil, and that oil must come from the West and the South.

The eastern United States fields and the Russian fields are falling off and the western and southern United States fields are increasing in enormous proportions. Besides this, new Western and Southern fields are being constantly discovered. Alaska is regarded as an important field for prospecting at present.

The Standard Oil Company, therefore, has recognized the coming great importance of the new oil fields as the future source of supply, and has taken steps toward their development to a high degree. For this purpose the vast improvements are to be made at a cost of probably \$200,000,000. The immediate improvements, besides the numerous pipe-line constructions, include the erection of a big refinery at Kansas City, the employment of a fleet of oil steamers on the Great Lakes (which in part separate Canada and the United States) and the construction of ports specially for the docking of the oil steamers. Five of these oil steamers are already built and will be placed in commission this season.

3,450 Miles by Auto—Wonderful Fifteen Days' Run.

AN interesting account was given in a recent issue of the *New York Times* of a remarkable automobile run half-way across the American continent, made by Mr. F. A. La Roche from New York to St. Louis and return, a distance of 3,450 miles, without stopping his engine. A huge, twenty-horse-power touring car was used to accomplish the feat, which has no parallel in motoring history. The trip occupied fifteen days and two hours of continuous running.

In the course of the double journey many interesting and diverting occurrences were experienced by the tourists—there were four of them—and a few hair-breadth escapes were thrown in for good measure.

Another remarkable test of speed and endurance was made last month, when the world's record in continuous automobile speed and endurance for

1,000 miles was broken by Charles Schmidt, on the Grosse Pointe, Mich., U. S. A., mile track. Mr. Schmidt drove an American-made car, 1,000 miles without stopping the motor in 29 hours 53 minutes 37 3-5 seconds, averaging 33½ miles per hour for the entire distance. The car was started at 6.16 P. M., Saturday, August 6th, and the 1,000 miles were completed at 9 minutes 37 3-5 seconds after Sunday, midnight. The motor was never stopped, and the only stop of the car itself was on account of tires.

The first 500 miles were made without stopping either the car or motor in 15 hours 5 minutes, averaging 33 miles per hour throughout the entire night. The fastest mile was made in 1 minute 25 3-5 seconds, which is at the rate of 42 miles an hour.

New Uses Discovered for Old Paper.

SOME of the most important American industries in the chemical line have been founded upon the utilization of what was previously thought to be waste matter, as has been told at some detail in previous issues of *THE AMERICAN EXPORTER*. An additional chapter on the subject is worth reading.

"New uses for old paper are being found almost daily by the different trades and by people who have a little ingenious turn of mind," said a New York junk dealer recently. "You don't see much waste paper thrown away nowadays, and when you consider the great amount that is daily accumulating it seems remarkable. The newspapers are reeling off tons of paper every day. All this great quantity of paper must be destroyed or used. There are eager scavengers of the city after every stray paper and bundle of wrapping paper. If it were not so the Street Cleaning Department would have to organize a special corps of men just to collect newspapers and burn them.

"Most of the newspapers are gathered up and converted into marketable paper again, and some go in with the rags to make various kinds of commercial material; but outside of these two lines of industry the paper is made into different useful articles of a wonderful nature. The newspapers are made of the spruce pulp, and by a steaming process they can be reconverted into a smaller pulp again. This pulp is not so good as in the first instance, and no one has yet found a way to make it possible to use it over again for newspaper work. However, it is chewed and steamed up and is then used for many other purposes. Wood-pulp novelties, lead-pencil-holders, paper-weights and ash-receivers are manufactured from this waste paper.

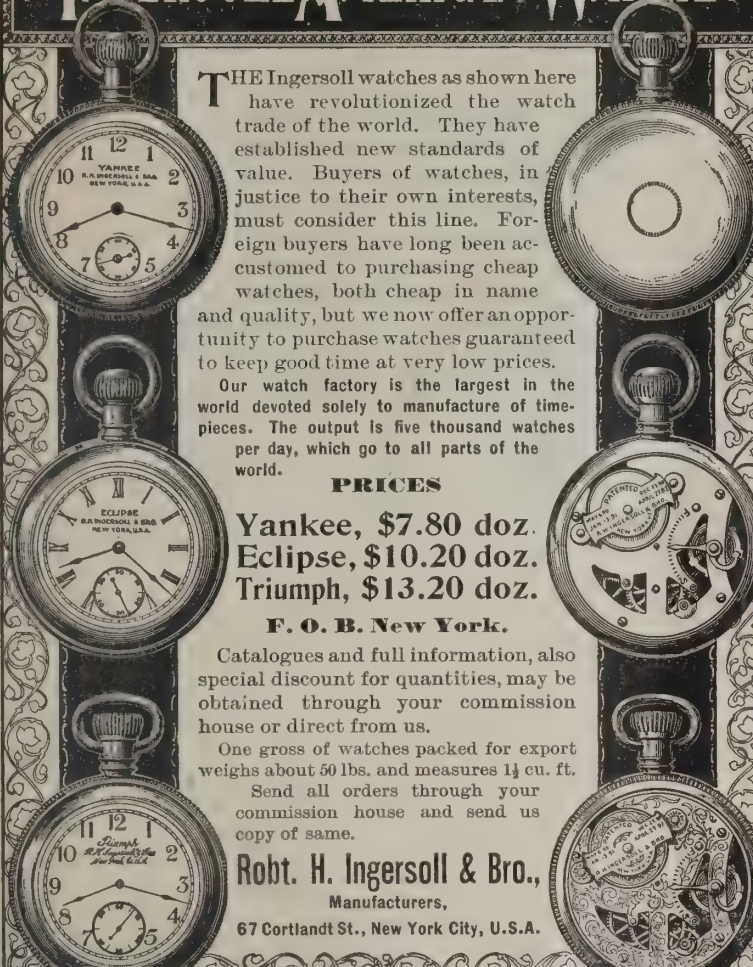

"Of course, there are experimental workers in waste paper, and some of them are working on problems which appear very easy of solution, but which in reality are most difficult. For instance, what seems easier than to use the paper over again for printing? Why not boil and steam your waste paper and roll it through machinery into new sheets for the daily presses? Nothing appears at first sight easier, but there is nothing that seems to give back to the paper the life which the process of printing takes from it. It is dead paper. It lacks vitality, strength, finish, and it is mixed with inks and chemicals. If any man can rejuvenate the paper and make it fit for the presses over and over again he will make a fortune and revolutionize the printing business. What a boon it would be to a newspaper to run its waste paper back again and buy in old copies of the early editions for use in the Sunday edition! Yet I firmly believe that some day we will come to that. Then the price of newspapers will go down. No paper company can control the market of spruce trees to force up the price of cheap-grade paper. It will be a benefit to the publishers and the reading public as well. To-day papers are printed and sold at a penny a copy simply because paper-making has cheapened the process to such a wonderful extent, but we have not yet reached the limits. There are more improvements ahead which the present generation has far from anticipated."

Mechanical Refrigeration on American Railways.

THE American scientific engineer has achieved one more victory over natural ice, and now has constructed a refrigerating machine for freight-cars, which forms an integral part of the car, and does away entirely with the necessity of constantly refilling the refrigerating-chamber with ice during its journey. This new device, which has recently undergone successful tests, consists of a small refrigerating-machine for each car, located in an enclosed casing beneath the car, and deriving power by gearing connected with the axle of one of the trucks. The machine includes a compressor for condensing the gas, usually carbon dioxide, circulating pipes which cool the car, and a condenser for abstracting the heat from the condensed gas. The principle underlying is that common to most systems of mechanical refrigeration, and is based on the fact that a gas expanding extracts heat from the vicinity, while a gas being compressed absorbs heat. The function of the condenser is to withdraw the heat from the gas that has been compressed, and for this purpose water is employed, which in case of need can be supplied from engine hydrants, while rain-water from the roof of the car is also employed.—*Harper's Weekly*.

Framed Pictures and Moldings.—Great advances have been made in America in the manufacturing of frames for pictures, mirrors, molding and in the industry of furnishing framed pictures to the trade abroad and at home. One of our American firms has been very successful in this direction and readers of *THE AMERICAN EXPORTER* who are interested will do well to send for a copy of the handsomely illustrated catalogue No. 105, which is issued by Nathan H. Hirshberg & Son, 215 and 217 West Pratt street, Baltimore, U. S. A. The catalogue is something that must be seen to be appreciated.

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices. Our watch factory is the largest in the world devoted solely to manufacture of time-pieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

F. O. B. New York.

Catalogues and full information, also special discount for quantities, may be obtained through your commission house or direct from us.

One gross of watches packed for export weighs about 50 lbs. and measures 14 cu. ft. Send all orders through your commission house and send us copy of same.

Robt. H. Ingersoll & Bro.,
Manufacturers,
67 Cortlandt St., New York City, U.S.A.

Cary's Universal Box Strapping.

Made of Soft Steel through which nails can be easily driven.

Put up in coils of 300 feet each and packed 20 coils in a case.

Made in four widths, viz.:

$\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$ and 1 inch.

Patented in all countries.

Packed very securely for export.

CARY MFG. CO. 19 & 21 Roosevelt St., New York.

Cable Address: "CARLEIO."

Codes used: A B C, 4th Ed.; A B C, 5th Ed.; Western Union.

**EMBOSSSED METAL CEILINGS,
Side Walls and Center Pieces
LARGE AND COMPLETE LINE
OF CLASSIFIED DESIGNS.**

New Catalogue "A" sent on request to those interested.

MILLS NOVELTY CO.

INCORPORATED.

CAPITAL, \$500,000.00.

CHICAGO, U. S. A.

The Mills-Chicago.
With Music Box.
Weight, boxed for
shipment abroad,
about 340 lbs.

Mills Novelty Co.'s Works, Chicago, U. S. A.

Largest Manufacturers and Exporters
in the world of all kinds of

Coin- Operating Machines.

Our 80-page catalogue, just issued, profusely illustrated, in colors, describing the many styles of **Coin-Operating Machines** made by us, will be mailed post-paid to all parts of the world.

Nearly all our **Coin-Operating Machines** can be made to be operated by the coin of any realm.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify **MILLS NOVELTY CO.'S COIN-OPERATING MACHINES**, and to avoid errors, please mail us duplicate of order.

BUSINESS AS AN EXACT SCIENCE.

The American Expert Reduces the Multiform Processes of Great Industries to a Perfect System.

ONE of the most notable features of the march of American prosperity in recent years and a feature that is as much a cause as a result of that prosperity is the modern idea of applying scientific principles to the conduct of our industries. Modern business has changed in most industries and is very rapidly changing in others from the old order of slipshod, rule of thumb activity to a comparatively exact science and a study of the subject reveals the fact that greater efficiency of the modern business man is due—if not altogether, in great part—to the intelligently applied scientific methods of the expert who not inaptly has been termed a "business engineer."

Business experts are of many kinds, from the man who has a new wrinkle in simplifying the bookkeeping or some new appliance for filing records so as to save clerk hire, to the production engineer who reorganizes the departments, factory processes and the whole accounting system of an industry forming of the three a compact efficient whole. The most interesting and important part of an expert's work, however, is in devising systems and methods of ascertaining the actual cost of production. What the manufacturer of the present day desires to know and is willing to pay for liberally is a system that will tell him the actual cost of each article he makes, not at the end of a year, but while it is in the process of making. Such knowledge is of incalculable help in reducing expenses to a minimum and it also does away with blind competition that ruined many a business man in the old days, for it supplies an accurate basis for fixing selling prices that are fair to manufacturer and purchaser alike.

As an instance may be cited the case of one of the largest manufacturers of agricultural implements in the country. After many years of business prosperity he found increasing competition so keen that his profits disappeared. He called in an expert.

"I manufacture," he said, "thirteen different classes of articles, such as plows, harrows, cultivators and so on. My price-list shows more than 3,000 finished parts and complete machines. Now, I want to know just how much each article costs me to make and just what my profits or losses are every month in each class in each different territory where I sell my goods."

The expert spent two weeks examining the plant and inspecting the processes of the work. Then he devised and installed a system of collecting, just as they actually occurred, all the items of cost on each article.

The expense was nearly \$10,000 a year for the cost accounting department, but the accurate knowledge acquired put the business on a profitable basis.

The installation of a system demands tact, patience and personal enthusiasm. Employees are frequently averse to changing the methods; and to make any system go needs the active cooperation of all. Continual objections have to be answered and a repetition of explanations made *ad nauseam*.

"I don't like this system at all," said a young woman in an accounting department.

"Why?" asked the expert.

"Because you have to be so awfully accurate," was the reply.

The keeping of stock-rooms and a stock account makes a monthly balance possible without taking an inventory. Moreover, it affords an easy, almost automatic way of always keeping the proper amount of stock on hand without overstocking. The manager fixes a minimum below which any kind of stock shall not go and a maximum over which it shall not go. The stock-clerk is directed, whenever the balance of the stock-book shows that the minimum is approached, to order enough to bring the amount on hand up to the maximum.

An increase in any business always involves a necessity for more complex organization and for subdivisions of responsibilities. The duty of attending to details must be intrusted to subordinates. Less and less as American industries grow can the executive heads keep in touch with the daily course of the work. But a cost system properly handled gives them a way of closely watching even the smallest details.

Some of the most remarkable achievements of "business engineers" have been in gathering and systematizing data for fixing the price of piece-work. The great difficulty with this theoretically ideal plan of remuneration has been a lack of accurate information on which to base a satisfactory standard. The price generally has been set by estimates of the time it should take a workman to do the work. If some men increased their output largely the employer almost invariably cut down the price, feeling that the estimate for time required had been too high. This has happened so often that labor unions are usually opposed to the system and often put a limit on the amount any man may turn out.

A certain expert, in reorganizing the business methods of a steel plant, had the workmen in one department timed on absolutely every step of their work. Even the time taken to lift a piece of iron from the floor and place it on the planing table was kept. For a year and a half these data were collected on all kinds of iron and under different rates, and then a final system of payment was fixed, based on the average. The management were certain that they knew the exact time in which a good man could do the work, and if any employee could shorten it he was welcome to the extra pay. Consequently there was no restraint on effort. A year's trial showed an increase over the production under the daily wage system of 7 per cent. and an increase in wages of 18 per cent.

It is easy for men accustomed to doing work in certain ways to overlook their disadvantages. It often requires some extra bracing up to induce a manufacturer to expend large sums for new devices and appliances for saving time and labor. The expert often gives just this necessary stimulus. From wide experience and observation he knows about nearly all inventions and mechanical devices. In a certain wholesale hardware house the goods to fill orders were assembled in the stock-room, carried on trucks to an elevator and then down to the shipping-room. An expert spent half a day, watch in hand, keeping the number of minutes the employees wasted waiting for the elevator. "You lose too much time there," he said to the owner. He devised a slanting chute from the stock-room to the shipping-room, and turned a section of the floor into a moving platform leading directly into the chute. A bundle dropped anywhere on the platform was carried to the chute and the force of gravity did the rest.

Even minute odd details receive attention. A small country manufacturer, for example, complained that his local competitors followed his shipments to the freight depot and stole the names of his customers. He did not want to ship the goods to his own order. The expert drew up a tag in the shape of an envelope, having inside the name of the customer and his address. Outside was a notice to the freight agent at the town of destination to open the tag as soon as the goods arrived.

Experts solve large problems by just this science of the minute and the mastery of details. They have blazed out the way for a new profession, the principles of which can be taught. Most of them have many young men under them whom they are training. One company gives each man who enters its employ a month's instruction by lectures before he goes out with trained men to see and help in actual work.

The Massachusetts Institute of Technology includes in its curriculum a course in industrial management. Young men can now fit themselves for business in the same way that a man fits himself for law or for medicine. Modern American business has, indeed, become a science.

Traveling Machine Shop's Advantages.

A PROPERLY equipped portable machine shop is one of the most recent additions to their facilities of one of the large American construction companies. They had often experienced much inconvenience in the erection of rolling mill and other large plants from the necessity of having on the spot several machine tools with some means of operation on which to do the small jobs of fitting, etc., which cause so much delay if the various parts have to be sent to a machine shop.

The expense of installing tools and the depreciation on account of exposure was excessive, and the machine-shop car has proved to be a great success. It is sent to a plant whenever the erection is to begin and remains there on a siding ready for immediate use until the work has been finished, when it is despatched to the next field of operations.

The car itself is an 80,000-pound capacity box car, with standard inside dimensions of 8 feet 6 inches by 36 feet. The motive power is obtained from an eight-horse-power gasoline engine. The danger of using a gasoline engine in such a small place where a forge and combustible material would often be used was overcome by bolting the gasoline supply tank underneath the car. For cooling the engine cylinder, a 300-gallon water tank was placed inside the car.

The car is equipped with a 20-inch lathe, an 18-inch stroke Stockbridge shaper, an emery wheel grinder, a forge, anvil, good-sized work bench, and all the necessary auxiliary tools for these machines.

The car may be lighted by electricity or gas. Acetylene and steam pipes for heating purposes are run along the side of the car.

It has been found of much practical value in field work, saving the superintendent of erection much time, trouble and traveling when machine work is required without delay.

Big Feat in Boring Tunnels for a Canal.

ONE of the most remarkable feats of American engineering enterprise is an irrigation canal which will pass through three tunnels. The longest of these, 1,400 feet in length, is now being bored in Nevada.

The rocky character of the greater part of the country to be traversed necessitated the employment of tunnels. The canal will be 23 feet wide at the bottom, 53 feet at the top, and 15 feet deep and will receive 1,400 cubic feet of fresh mountain water per second.

About 2,000 men are employed in this work, which will cost the Government nearly \$1,000,000, although the length of the canal is only thirty-two miles. It will open vast areas, hitherto arid and waste, to the homesteader and to agriculture, and will greatly promote industries in contiguous tracts.

Tool Machinery.—Our tool machinery has been making rapid progress abroad. Consul Langer, at Solingen, Germany, mentions as a straw the following: "The imports from the United States have more than doubled during the first three months of 1904, being 578 tons, against 269 tons in 1903; appearances tend toward a still higher increase. This seems to be the chief reason for the continued agitation of German tool machine factories for higher rates of duty."

The top image shows a standard 8x8 chessboard with alternating light and dark squares. The board is set within a decorative, irregular frame. The bottom image shows a perspective view of a large, ornate board, likely a backgammon board. It features a central square area with a diamond pattern, surrounded by a wide border with a grid of squares. The board is set within a decorative, irregular frame.

No. A 20. 50 inches long; 30 inches wide; 48 inches high; weight, 230 pounds.
No. A 21. 55 inches long; 30 inches wide; 48 inches high; weight, 250 pounds.
No. A 22. 60 inches long; 30 inches wide; 48 inches high; weight, 260 pounds.

A MODERN, neat and practical desk. Quarter-sawed white oak front. Drawers have moulded fronts, carved wood pulls. Center drawer with flat keyed lock. 14 pigeonhole boxes with quartered oak fronts and bronze label holder pulls. Closed paneled back.

Arrangement.—Letter file in right-hand pedestal with index and compressing device. Card index drawer in right-hand pedestal supplied with follow block attachment; four drawers in left-hand pedestal. Double or deep drawer in right-hand pedestal partitioned for books. Can furnish drawers both sides if desired. Finish—Fine gloss finish, golden oak.

Special attention given to filling Export Orders. Send for Illustrated Catalogue and Export Price List. Order direct from factory or through buying and shipping agents, and send us duplicate of orders, so as to avoid mistakes.

Manufactures Gain in Our Exportations.

MANUFACTURES formed nearly one-half of the exports from the United States in the month of July. Speaking with statistical accuracy, they formed 48.27 per cent. of the total domestic exports. For the first time in the history of the United States manufactures are exceeding agricultural products in the exportation of domestic products. Figures just issued by the Department of Commerce and Labor, through its Bureau of Statistics, show that in July manufactures exported amounted to \$40,000,000, against \$31,000,000 of agricultural products, and in the month of June manufactures amounted to nearly \$42,000,000, against \$37,250,000 of agricultural products. In former years agricultural products have greatly exceeded manufactures in the exports of the country, and it is only in recent months that manufactures have equaled or exceeded agricultural products in the export statements.

Even in the seven months ending with July, 1904, agricultural products exceed manufactures by nearly \$100,000,000, but in May, 1904, manufactures for the first time in the history of the country exceeded agricultural products in the statement of domestic exports, and this was again the case in June and in July.

That there is a marked growth in the exportation of manufactures is shown by a comparison of the figures of 1904 with those of earlier years. The total value of manufactures exported in the seven months ending with July, 1904, is \$285,495,728, or an average of more than \$40,000,000 per month. In the seven months ending with July, 1903, the total was \$244,607,852, an average of \$35,000,000 per month. At this rate of increase the exports of manufactures during the calendar year 1904 would exceed those of 1903 by about \$60,000,000 and bring the grand total for the year far in excess of any preceding year.

What Porto Ricans Think of America.

SOME 650 Porto Rican school teachers who sailed for their native island on two United States army transports last month, carried with them ineffaceable impressions that will be of the utmost value in the education of the young, as well as in disseminating information among the islanders in regard to the character and extent of the United States. A remark made by one teacher to a New York *Evening Post* reporter would doubtless have been made by all.

"You Americans," said the teacher, "are so big in every respect. Everything is on the grandest scale. Your railroads, your cities, your stores, and last but not least, your hearts, are big. I think it will do incalculable good when we teachers get back to our homes and tell our friends what a wonderful country and what a wonderful people you are."

These teachers, upon their return, will scatter all over Porto Rico and carry to listening audiences the story of their visit to the United States. They will repeat the story to other listeners, to be passed again from mouth to mouth, and the effect will be to create in the Porto Rican a pride in the fact that he lives on American soil and under the ægis of the great Republic. It will arouse in him a manly desire to accomplish something in this life.

But the greatest influence will be found in the school room and among the rising generation. That army of teachers controls the juvenile mind in Porto Rico, and the generation that is growing up under the care of these teachers will know all about the great nation to which they owe allegiance, and will aspire to be worthy of its citizenship. Our Government never did a better act in all its history than that of bringing the Porto Rican teachers here to learn something of the country and its people. The effect of that act will be one of incalculable good. It will fit Porto Rico for statehood.

All of which is an illustration of the progressiveness of our people and the wise discrimination of our Government officials who use our war vessels in times of peace for the purposes of educational and ultimate commercial advancement of the countries and its dependencies.

Summer Homes That Are Portable.

AMERICAN people are great hands to enjoy warm-weather vacations. A writer in *Country Life in America* has this to say about one way of enjoying such outings: "A great advantage of the portable house for summer outings is that it can be used every year in a different place. A family may have a change of scene every season. The cost of a portable house varies from \$50 to \$500, and is about one-third less than that of a house of the same size built by a carpenter. As summer cottages, they meet the needs of those who want to spend the summer in the country, but who cannot afford to own a house and lot, nor to rent an expensive country home. It is an easy matter to hire a small plot of ground, either at the seashore or in the mountains, at a low cost, and spend the summer in one of these houses. The cost of transportation by freight is not great, for they can be packed into a very small space, each part being flat. They are not so plain as one might suppose, for many of them have piazzas, or wings which may be added if desired.

"I know of such a house in which a family of four have spent their summers at the seashore for several years. The house is divided into five rooms—one used as a living room, three of the others as bedrooms and one as a kitchen. In the first place, the house cost them about \$200, the transportation about \$10, and they pay the landowner \$50 a year for the privilege of putting up the house for the summer. They find it much cheaper than board-

ing, and much more comfortable than camping in a tent. In the winter the house is either left standing or packed away in a neighboring barn. Two men can put up this portable house in a few hours with a screwdriver, a monkey wrench and a hammer."

Queer Freaks of Speed in Battleships.

MANY important facts have been developed by the cruise of the United States battleship squadron to European waters. One of these was that, although rated at much the same speed, some of the ships are far faster than others, while some burn a great deal more coal than others of the same engine power. As the basis of the efficiency of the fleet is homogeneity of squadron, the American Navy Department is giving these questions close study.

One of the battleships averaged a rate of 3.15 knots for each ton of coal consumed, while another averaged only 2.46 knots per ton. Of two sister ships in the squadron—and it is not stated whether these were the 18-knot Maine or Missouri, or the 16-knot Illinois and Alabama—one burned 50 per cent. more coal than the other. The difference was due to the fact that the foul bottom of one made its progress more difficult. It had not been in dock for a bottom cleaning for nearly a year.

It is a question if the battleship squadron will go to European waters next year. Among the officers, especially the younger ones, there is a strong feeling that the summer should be spent on the North Atlantic coast rather than on a foreign station. This is not because the officers desire to visit American watering places. It is due to the desire of many of them to see their families.

First Heat in Race to Build Battleships.

IN the great race that is now on, as reported in a recent issue of THE AMERICAN EXPORTER, between the New York Navy Yard and the Newport News Shipbuilding and Dry Dock Company for honors in battleship construction—a contest that may settle the question of warship construction at American Government navy yards—the private yard won the first heat on August 27th, when it launched the 16,000-ton battleship Louisiana, amid the cheers of a great crowd and the shrill blasts of many steam whistles ashore and afloat.

In the launching of the Louisiana another record was established, the new battleship having the largest displacement of any armor-clad put overboard up to this time for the United States navy. Her sister, the Connecticut, which is building at the New York Navy Yard, will follow closely on the heels of the Louisiana, the date for her plunge having been fixed for September 29th.

American Cruisers Engage in Close Race.

IN a speed race of about 450 miles last month from Newport, U. S. A., to Hampton Roads, further down on the Atlantic Ocean coast, between the American cruisers Minneapolis, Columbia and Prairie, under command of Admiral Wise, the Minneapolis, whose record is something lower than the Columbia's, passed the finishing point three minutes in advance of the Columbia and five minutes ahead of the Prairie.

The Minneapolis beat her former running record, making 20.4 knots during the entire trip. This is remarkably good time, considering the fact that the engine-room crew was made up almost entirely of inexperienced men.

Our Implements Appreciated in South Africa.

UNITED STATES CONSUL W. R. BIGHAM, at Cape Town, Cape Colony, reports: "The inroads being made in the trade of this colony by American agricultural implements, and the fact that the South African farmer recognizes their excellence and will have them if he can secure them reasonably, has excited a good deal of jealousy in the minds of the British merchants here. The mere fact of a British brand on an implement or machine will not capture the farmers here. They want the best, regardless of where it is manufactured. As I do not live in an agricultural district I am not able to say to what extent the different agricultural implements could be sold, but I am told the American hand and sulky plows are very much admired by farmers in the Orange River Colony and Natal."

Better Steamship Service.—American exporters and shippers are experiencing much better business activity on account of increased transportation facilities and lower freight rates. The freight rates, both by rail and ocean, are now very reasonable on the majority of commodities, the ocean freight rates being particularly low. The latter has assisted in building up the export trade, and if the rates continue upon the same low basis there is a fair prospect that the export trade can be still further developed.

Want American Goods in Abyssinia.—Robert P. Skinner, United States Consul-General at Marseilles, France, reports that Goolamally M. Mohamedally & Co., of Harrar, Abyssinia, would like to receive prices from American exporters for boots, shoes, saddlery, rifles, revolvers and swords, camp furniture, jams, pickles, biscuits, candy, table salt, corrugated sheet iron, round iron disks, wire nails, wrought-iron nails, sheet tin and screws; enameled ironware, glassware, knives and beads. Prices should be quoted c. i. f. Djibouti, French Somaliland. Consul Skinner has received a very similar letter from Ohannes Assadourian, Addis-Ababa, Abyssinia.

Fighting Fire in an American Mine

ABOUT a month ago a systematic effort was started to extinguish a fire that has been raging for fifty years in one of the mines of the anthracite coal region in the American State of Pennsylvania.

In all that time the mine has not been worked. It still contains, mining experts calculate, millions of tons of fine coal, chiefly in a vein that runs from thirty to sixty feet in thickness. Preparations for the fight, which, it is estimated, will cost \$1,000,000 and will take two years to win, have been under way for a year, following a careful survey of the workings, the extent of the fire and the possibility of mastering it. All previous efforts have been confined to a spasmodic flooding of the burning portion, which has not been effectual.

The mining officials have discovered that the fire is raging in the loose coal above the water level, that the great pillars of the huge vein are still standing undamaged, and that all the lower veins are intact, the millions of gallons of water which have from time to time been poured into the mine having saved the coal despite the fact that it had no other effect upon the fire than confining it to a certain portion of the mine.

The fight will be conducted from the mountain top above the highest levels of the workings, and not far from the spot where it is believed the fire started fifty years ago, when some timbers were ignited by a miner's lamp, or the flame of a gas feeder.

A mixture of culm and water will be the fire-fighting agent. This not only smothers the fire wherever it reaches it, but hardens into a mass almost as solid as coal, and forms a pillar which prevents the workings caving. It will have the valuable effect in this case of extinguishing the fire and filling up the fire-eaten workings, so that the adjoining pillars, which have supported these workings, may be removed. The company will thus gain great quantities of coal which could not otherwise be touched.

Four 100-horse-power boilers have been erected on the banks of the Schuylkill River, and will operate two mammoth duplex pumps, which will pour into the mine 1,728,000 gallons of water every day. This water will be carried 1,600 feet in ten-inch pipes from the river to the top of the mountain. There it will be turned into big troughs and mixed with immense quantities of the culm, which will be hauled by train from clum banks six miles away. The mixed culm and water will then be run down steep chutes into the burning workings.

When the fire is all out and the mine again ready to be worked, the company will erect one of the largest breakers in the region, and the breaker and mine will give employment to over 1,000 men and boys.

Progress of Piano-Making in America.

IN an article published recently in *Leslie's Weekly* on the progress which is being made in the manufacture of pianos in America, the writer, Charles Ellery Hall, gives an interesting account of the growth of the industry. He describes in detail the methods in force in the factories of an establishment which he considers to be "the greatest manufacturer of pianos and organs in the world."

To this and similar methods employed by other large makers in America Mr. Hall ascribes the fact that American pianos, on account of their excellence, have come to be recognized as standard by all European countries. During the last twenty-five years the shipments of the American product have steadily increased, notwithstanding the higher price of American instruments. The importation of pianos from Europe to the United States is now, and has been for some years, practically a thing of the past. These statements, Mr. Hall declares, apply to "all classes and kinds of musical instruments." This condition of affairs is due, he believes, to the genius and ability of Americans who have invented and introduced improvements and devices that have added quality of tone and durability to the instruments.

The Germans have previously excelled in technique, or the art of reducing to a science ordinary mechanical skill, the Scandinavians as expert cabinet-makers and the Italians as specialists in carving and decorating. Americans, however, says Mr. Hall, are fast becoming proficient in the various specialties named, particularly in the State of Illinois, and they lead in piano-tuning in America to-day. It requires a keen, active sense to discern and correct sound waves. The strings must vibrate in unison, each with the other, and it seems that the American temperament is the ideal one for the highest grade of efficiency in the production of musical sound and tone. The finished instrument must be able to withstand the criticisms of intelligent and critical purchasers.

The superior quality and the vast quantity of lumber obtained from American forests have been among the chief factors that have enabled piano-making to reach its highest perfection in this country. The woods used in American piano bodies grow principally in American forests. They are spruce, elm, black walnut, oak, poplar, hard maple and birch. Foreign mahogany, ebony and rosewood are also used.

Mr. Hall's is a strong indorsement of American instruments, but that it is not too strong is shown by the ever-increasing demand for pianos noted by leading American makers. Some idea of this growth is conveyed in the fact that one company issues, at frequent intervals during a year, single factory orders for the manufacture of 1,500 pianos at one time. Ten million feet of lumber—over 8,000 carloads—are worked up and 200 tons of glue are used in one year in the manufacture of both pianos and organs by this company. Eighteen hundred employees are on the pay-roll, twenty branch offices are

maintained in America and agencies in foreign countries are being established as rapidly as the factory output can enable care to be taken of the trade.

American Typewriters and People Who Use Them.

THERE is comfort for typewriter operators in knowing that highly aristocratic people write on the machines and some of them use the up-to-date typewriters that are manufactured in America and exported to other countries. Mrs. Roosevelt, the wife of the President of the United States, despite her many social and family duties, frequently relieves her secretary and dashes off a letter on the typewriter—if it is not one that must be written by hand—in a style that does credit to the machine and to herself.

In America most men in important positions, who have not become too old physically, are quite as adept at the typewriter keys as are their secretaries. They frequently write the body of letters and turn over the details of addressing and mailing to their subordinates. It is not surprising, therefore, to learn that royalty uses typewriters, and it is still less surprising to ascertain that American machines are in demand and use in quarters where only the best of everything is tolerated. In fact, the inability to use a typewriter among people who are "higher up" anywhere on the globe is now considered to be lacking a useful accomplishment. One might as well expect an ambassador to France to be ignorant of the French language—the diplomatic language—as to be unable to compose a letter upon a typewriter. Some official correspondence cannot be carried on in this way, but the people higher up are gradually breaking down the barriers, and even in diplomatic circles there is a tendency to modernize. Only last month the editor of *THE AMERICAN EXPORTER* received a personal letter from a prominent foreign diplomat who is accredited to Washington. It was informal and its writer said: "I hope you will excuse my use of the typewriter, but my own hand is wretched, I have no one at hand to write for me and I wish to answer you promptly." That letter will be held to the credit of the diplomat, for on inquiry it was found that he had written it on an American typewriter and that he was more proficient than the average operator. It would make a very readable story for *THE AMERICAN EXPORTER*, or any other paper, but the imposition of secrecy in the second letter makes it impossible to say more.

Regarding the use of typewriters otherwise a writer in the *New York Telegram* declares that the Princess of Wales runs her royal fingers over the keys of the typewriter as nimbly as any young lady who earns her living by it. Nearly every one connected with the typewriting world—those, we mean, whose duty it is to sell the machines—knows of the surprise visit the Kaiser paid one morning, accompanied by a certain German prince, to the depot of a firm well known in London, and there selected a machine for his own private use. His Majesty is quite an expert typist; so, too, his Majesty of Wurtemberg, and the Crown Prince of Saxony.

When Prince Max, of Saxony, served religion in the capacity of a humble priest in the East End of London a few years ago, he bought a machine, says the *Telegram*, quoting *Home Chat*, and caused the useful instrument to be taught to the waifs and strays of Whitechapel. He himself is a capital typist, and in his professional capacity at one of the universities of Saxony he finds it a useful accomplishment.

In the days when the genial and popular Princess Maud (Princess Charles, of Denmark) used to go about the country and pay quiet visits under the name of plain "Miss Evans," her Royal Highness was fond of typing her letters to those of her more intimate friends. But perhaps of all the members of the royal family the Princess Christian is the ablest typewriter. The machine used by the King's sister is fitted with ivory keys, and is silver plated, and it has a German set of characters as well as English.

"Nothing pleases the King of Greece—brother of Queen Alexandra—more than the typing of letters," says *Home Chat*, "and most of the nobles of his kingdom have in their keeping to hand down as heirlooms His Majesty's typewritten letters, signed with his autograph. It is interesting to see, too, that most of the correspondence emanating from Marlborough House is now typewritten—that is, the Prince's own—but whether his Royal Highness is following in the footsteps—or, should we say handsteps?—of his royal spouse, and is typing his own letters, we are not warranted in saying. The impression is he is doing so.

"The versatile Lord Rosslyn is another noble typist who regards his machine with longing eyes. So expert is he as a writer, the speed at which he can write putting into the shade many a clerk typist, that during his detention as a prisoner of war at Pretoria he produced a typewritten newspaper there, edited, printed and published straight from the machine he took out to the front with him. Sir Sydney Waterlow, than whom there are few men busier, would in his zeal and devotion to typewriting be prepared to classify it as one of the fine arts, one might say. And, indeed, such writers as S. R. Crockett, W. L. Alden, Fenn and Arthur Wing Pinero, typists all, might be said to be of the same opinion.

"The pathetic side of this interesting subject is to be found at the Royal Normal Blind College, Norwood, where there are in use fully 100 typewriting machines. These are worked in the ordinary way by the sightless pupils, who, after a course of training, become very able operators. Mentioning this reminds us that there is in London at least one journalist who, practically blind, is, nevertheless, able to sit down at his machine day after day and type off scholarly leading articles upon the topics of the day, and folio after folio will tumble off his machine without so much as a literal mistake occurring."

Big New American Steamship in Commission.

MOVING majestically and slowly in haze and smoke the big new steamship "Minnesota," twin sister of the "Dakota," docked in the port of New York last month. These ships are intended for the Pacific Ocean trade, connecting the United States and the Orient by stronger transportation ties than at present. The "Minnesota" is the first of the two to come into effective being and her arrival in New York harbor was an occasion for the great demonstration which occurred. Within a few days of the time this article is printed the "Minnesota" will be on her way around Cape Horn and up the Pacific Ocean to Seattle, the American port from which she will sail to the Far East.

We have printed descriptions of the "Minnesota" and her sister ship, but there are some interesting features of the vessel that will be of interest to our readers, even if in some general details there may be a repetition. It is only natural to look for Americanisms in the "Minnesota," and they are present. The most noticeable feature in the great ship—her cargo-carrying capacity and the fine passenger accommodations being passed over quickly—is the electrical equipment, the most extensive ever installed in any steamship.

There are six units, averaging 150 horse-power each, installed in special space near the engine rooms. Their electric power supplies energy for thirty-eight separate winches on deck for hoisting cargo, of twenty, twenty-nine and thirty-five horse-power. As an example of their capacity, it is stated that an electric twenty horse-power winch will lift three thousand pounds at the speed of 170 feet a minute with a single whip.

The ship's immense rudder is turned by electric power, the electric steering gear being under absolute control either from the bridge, the bridge house or the pilot house beneath. There are warping capstans to assist in berthing the ship, connected to 100 horse-power electrically driven motors. The ship is heated, lighted and cooled by electricity, and in the pantry the steam tables used for heating food or dishes have been supplanted by electric heaters. On the forward bridge of the ship is mounted a twenty-four-inch searchlight, whose light and control of movement are directed by electrical connection from the main bridge, 350 feet aft.

There is a complete telephone system for the use of passengers, 370 telephones being under the control of an operator at a central telephone exchange, the same as on land. Besides this, there is a complete system for the use of the navigating and engineering departments of the "Minnesota."

The "Minnesota" was not built for speed, but two triple expansion engines of 10,000 horse-power each drive the twin propellers and give the huge bulk a speed of fifteen knots. Steam is furnished at 250 pounds pressure from water-tube boilers. There is a complete refrigerating and fresh-water plant.

Waterweight bulkheads divide the engine rooms, and throughout the ship, which has also a cellular double bottom, there are transverse and longitudinal bulkheads, which renders sinking impossible.

Particular attention has been given to the comfort of the passengers. There are accommodations for 218 first-class and sixty-eight second-class passengers. The steerage space is allotted according to the custom of steamships plying between Oriental ports. There are separate accommodations for 2,300 Chinese, who have a pantry and a galley, commodious wash-rooms and an opium den where ventilation is unknown, all for their special use. This is aft on the main deck.

Forward on the main deck are berthings for carrying 1,300 soldiers. For the first-class passengers there is the usual library, women's room and smoking room, as found in the best of the Atlantic liners. The dining saloon, furnished in mahogany, has a seating capacity of 200. The promenade decks are unusually wide, and forward on the upper promenade deck is a deck space, awning covered, the full width of the ship, seventy feet at that point and fifty feet in depth.

In life-saving equipment the ship is abundantly provided with boats and life rafts. An American idea is shown in equipping one of the largest lifeboats with a hydrocarbon motor and propeller, in which the danger against fire is cared for by an electrical indicating system, which locates high temperatures in parts of the ship, and besides the usual appliances for injecting steam there is a special apparatus for filling with extinguishing gas any section of the ship where there is a fire.

Device to Prevent Seasickness.

NOTWITHSTANDING the high pitch of comfort and luxury attained by modern ocean passenger steamships, no reliable preventive or immediate remedy for seasickness has as yet been discovered. It will be good news then, for the many who look forward with dread even to a steam trip on the waters of a lake or land-locked harbor, to learn that the managers of one of the largest American steamship lines are taking steps to test thoroughly a device for diminishing the rolling of steamships in a sea.

This device, which is the invention of a German naval architect named Otto Schlick, according to a writer in a recent issue of *Harper's Weekly*, involves making use of the principle of the gyroscope familiar in the toy sometimes known as the Archimedean top, where a fly-wheel whose weight is concentrated near its circumference is mounted in gimbals so that it is free to rotate in any plane.

Herr Schlick proposes to mount a fly-wheel carried on a vertical axis in a frame which is suspended on a horizontal axis transverse to the length of the vessel, the whole mechanism being placed at the bottom of the hold. To

rotate the fly-wheel with the necessary high speed, electric motors or steam turbines would be employed. There would be hydraulic brakes and band brakes to restrain and regulate the motion of the fly-wheel when necessary. The effect of the rapidly rotating fly-wheel is to develop forces that would oppose the oscillation of the vessel, making it slower and reducing its extent materially.

An elaborate calculation was made of the size and weight of such a fly-wheel, and it was ascertained that for a steamer of 6,000 metric tons (5,905.5 English tons), a fly-wheel 4 meters (15.12 feet) in diameter, weighing 10 metric tons (9.842 English tons) and moving with a peripheral velocity of 200 meters (656 feet) per second would have a most marked effect.

Lighthouse for Dangerous Shoals.

ALBERT F. EELLS, an American inventor, has undertaken to do what some of the most distinguished engineering officers in the service of the United States Government have made repeated failures of—build a lighthouse that will withstand the fierce storms that rage around Cape Hatteras on the Atlantic Coast, and maintain a firm foundation on the treacherous shoals there. More than this, Eells has volunteered to put up such a structure, equip and maintain it for a full year before a penny is paid to him by the Government.

While Mr. Eells is confident of his ability to carry out this large contract, the Government engineers are highly skeptical and say that his lighthouse will surely be swept away, carrying with it all the money that may be invested in the enterprise. The history of the Government's attempts to put up a permanent light to warn navigators of the dangers of Diamond Shoals, is one of consistent failure, covering a period of ten to fifteen years. The strongest foundation and the stoutest ship have both been wrecked and pounded to pieces.

Last year Eells appeared in Washington with a scheme to build a lighthouse on the troublesome shoals. He was backed by several prominent statesmen, and in a remarkably short time secured the passage of a bill under which he is to put up a "substantial and sufficient lighthouse and fog signal of the latest and most approved construction" on Diamond Shoals. The foundation proper must be at least thirty feet high, and there is to be constructed above this a circular steel tower two hundred feet in height from which a light is to be displayed. Eells is to have a free hand in drawing his plans of construction below the 30-foot line; the work above that mark must be approved by the lighthouse board.

After the project is completed the Government will supply the lens and other apparatus necessary for the light signals, and then Eells will undertake to keep the affair safely anchored for the period of a year. If at the end of that time the structure is still above the waves, it is to be turned over to the Government for a four-year test. If it proves equal to the strain of that period the contractor will be considered as having fulfilled his pledge, and a check of \$590,000 will be handed to him by the Treasury Department.

In the event of failure none of Eells' associates nor his heirs is to have a claim against the Government on account of the lighthouse.

Automatic Features of New Steamship.

A FEW weeks ago the largest fresh-water steamship in the world was launched at Lorain, Ohio, U. S. A. It is 560 feet long—62 feet longer than any other steamship on the Great Lakes of North America. But the most wonderful thing about this new steamship is the fact that it will need about half the sailors and longshoremen that the smaller vessels need. Machinery is used in every case where labor can be saved.

The hold is made in the shape of a great hopper, 409 feet long, and with thirty-three hatches. It can thus be unloaded quicker than any vessel in the world, and by machinery, not by longshoremen. There will be no stokers. The furnaces will be fed by automatic machinery, and the ashes will be taken out by machinery also. There is a steam windlass for handling the two 8,000-pound anchors, a steam capstan and a machine for making fast the mooring lines. Every hatch is opened by machinery.

Last month the Augustus B. Wolvin, as the new vessel is called, took on a cargo of 12,500 tons of coal, thus breaking the world's coal-carrying record. The steamship is made of steel throughout, and cost \$500,000. If the steamships of the future are to be like the Augustus B. Wolvin, half of the sailors and longshoremen will have to look elsewhere for employment.

Will Exploit American Agricultural Machinery Abroad.—Mr. H. Culstrandt, representing the Roderick Lean Manufacturing Company, of Mansfield, O., U. S. A., has gone to Europe, where he will remain some eight months, during which time he will visit the leading importers of agricultural machinery in Great Britain and on the Continent. The Roderick Lean Manufacturing Company export their cultivators and harrows to all countries of the world. Their latest catalogue will be sent, upon application, to any importer of agricultural machinery.

Even Our Aborigines Are Progressive.—San Francisco has among its citizens a full-blooded American Indian who rides an American motor-cycle. The Indians used to be fond of bicycling when that sport was most popular, and one, at least, of the earlier Americans has turned his attention to the use of the power-vehicle.

The S. Howes Co.

Manufacturers of

"EUREKA"

Grain Cleaning Machinery,

Seed Cleaners, Flour, Bran and Feed Packers, Cement and Plaster Packers, Coffee Roasters, (Gas, Coal and Coke) Coffee Cleaners and Polishers, Coffee Hullers, Rice Hullers, Graders, Separators and Cleaners. Special Machinery for Flour Mills, Grain Elevators and Warehouses, Cement Mills, Rice Mills, Coffee and Spice Mills.

Catalogues sent free on application.

The S. Howes Co.,

THE EUREKA WORKS,

Established 1856.

Silver Creek, N. Y.

Rife Hydraulic Engine.

PUMPS WATER BY WATER POWER.

Irrigation with Rife engines.

Does not require any care or expense.

Water supply for towns, railroad tanks, country houses. All engines guaranteed. Catalogue free. Estimate furnished. Engines never stop. Pump water to 30 feet high for each foot of head. 4,000 engines successfully working.

RIFE ENGINE CO., 126 Liberty St., New York, U.S.A.

Olds

Gas and Gasoline Engines

Are backed by a broad guarantee that absolutely protects the purchaser against faults or breakage due to construction or material used. Its liberal terms are made possible by the experience of years which have established the success of the OLDS patents.

Stationary Engines, 2 to 100 H.P.
Portable Engines, 8 to 12 H.P.

Our new illustrated catalogue will be sent on request.

Olds Gasoline Engine Works

209 River St., Lansing, Mich.

PRESIDENT SUSPENDERS

Known everywhere for their comfort, style and service. Made in four weights; hundreds of different patterns.—Absolutely guaranteed—Genuine has "President" on buckles.

BALL-BEARING GARTERS

Swing like a pendulum with the motion of the leg. Lay flat; no binding; fit every leg perfectly. Easily adjusted. No stitching. Extra long adjustment.

Finest web, in many colors and patterns; packed in handsome boxes, 12 to carton. Handsome counter show-case with 3 dozen.

PRESIDENT SUSPENDERS, \$4.37½ per doz., for all models except "Extra Fine," which are \$7.10 per doz.

BALL-BEARING GARTERS, per doz., \$1.95.

Terms, net spot cash, f. o. b. New York.

Liberal Discount on above prices in Quantity lots.

Write for Discount Sheet. Illustrated Catalogue free.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest Medals:
Gold, Silver and Bronze.

Excels on Every Point.

Cheapest to Use in the End.

TESTIMONIAL. NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 13 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,

(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

THE WORLD'S STANDARD FOR FORTY-ONE YEARS
RACING COMPOUND for Wooden Yachts' Bottoms,
Bright and Smooth.

Manufactured Only by TARR & WONSON, Limited,
GLOUCESTER, MASS., U. S. A.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as the ordinary method and is the only utensil that will produce Lattice Potatoes. Is extremely simple to operate and sells rapidly wherever shown.

\$16.50 Upon receipt of SIXTEEN and 50-100 DOLLARS
\$100 in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] No. 6 X SLICERS, for Export only. Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our NO. 6 X SLICERS and other specialties manufactured by us.

HANDY THINGS CO.,

Manufacturers,

LUDINGTON, 40 to 50 Rowe Street, MICHIGAN, U. S. A.

THEY CUT, PLANT, SPRAY, DIG and SORT.

Aspinwall Potato Machines

Make Large Profits Easy by Economizing in Time, Labor and Money.

We make a strong, practical and automatic machine for every stage of Potato Culture; in fact, the Aspinwall is the only complete potato implement line in the world.

With Our Machines seed is quickly cut to best advantage. Planting, fertilizing and covering are accomplished at any depth and width of row desired. Spraying is effectively done for bugs and blight. Digging and sorting are made pleasant and agreeable work by our time and labor saving machines.

Our catalogue, illustrating and describing the various styles of

ASPINWALL POTATO

Planters, Cutters, Sprayers, Diggers and Sorters made by us, mailed postpaid.

LATTICE POTATOES

New York's Big New Subway Seen by Parisian.

PIERRE VEBER contributes to the Paris edition of the New York *Herald* a graphic letter from New York, describing our great new subway. We reprint below a substantial summary of his article, for it shows, through foreign spectacles, what we are doing in the chief city of America:

"New York was at a disadvantage, compared with other countries, from which all Yankees suffered cruelly. New York had no underground railway like the 'Metro' of the Parisians. One can imagine what a humiliation that was for a race so eager to have perfected every means of breaking one's neck in speed. But the Yankees have no longer any reason for envying anybody in this respect. They do to-day own a 'Metro' and, as must needs be confessed, the best of all the 'Metros.' Thanks to the directors, I have been able to visit it. The line will not be really in working order until October, but the tunnel is made, the rails are laid, and they are finishing the stations.

"At the station nearest the harbor we went down to it by the staircase of entry. There is no outside show. The features of the station building are quite plain. The frightful modern style of fairyland which spoils Parisian stations has been avoided. Down below, under the tunnel arches, we wait for the locomotive which will push the truck with wooden rails on which the seats have been placed. It is good to be there, underground. Above the people are stewing in a heat of nearly 100 degrees.

"We set off. A big lantern placed in front of the car throws upon the way a flare of light. Some ill-defined things come out of the obscurity, are lighted up for an instant, and vanish again into the night breath. Sometimes it comes to a halt. An engineer leaps to the ground, clears the road from obstruction, and we go on again. On the road, under the glare of the lamp, at the corner of the beams supporting the tunnel, appear the inquiring faces of the workmen, whom we have disturbed at their labor. Who are we, and what is our business?

"Yonder, quite at the tunnel's end, is a gap of light. We slacken speed; it is a station. The wall is tiled again with bright bricks. They are placing the turnstiles in position and cementing the stairs. The daylight falls, shaded through the glass of the roof. The equipment of these stations will be quite luxurious and in good taste, and, above all, they will not have the funereal uniformity of the stations of our line. Apparently, they have sought to diversify the appearance of the stations, to give the city under the streets an air of variety that it certainly lacks above. The arches of the subway are of great size. This long tunnel contains four tracks. Experts will know the resistance which it offers to the weight of earth above it and will be astonished proportionately.

"Such in real truth is the biggest subway in the world—and this is not a slight compliment in a country where everything, from the house to the accident, strains to be the 'biggest in the world.' And, in listening to these words, which regularly crop up in all the descriptions which New York people give you, I thought of the announcement made in a journal of lyric artists, 'X, the biggest dwarf in the world!' That must have been an American dwarf.

"Of the four tracks two are assigned to the general service, to the trains which stop at each station, of which there are thirty in all. The two middle tracks will be used by the express trains, which will make only four stops. It will thus be possible to traverse the island in twenty minutes.

"One can imagine in advance the terrible rush of office clerks and business men when they leave off about 6 o'clock their work in this illimitable city to get back to more pleasant districts where the houses are smaller and the trees are more frequent.

"I think of the probable bustle. Here all the citizens in the street have the air of people catching the train, but where they are catching the train they have the air of people taking a town by assault. What fine races there will be to the approaches of the platforms! How all the football-players, the baseball-players and players of other kinds of ball will struggle to gain their car. And what splendid lessons of energy, of self-preservation and of sovereign force the men will give to the women! Alas! the men there have few opportunities of making their supremacy felt by those who despise them and who have found in marriage a sure means of oppressing them!

"The locomotive keeps on pushing us. The endless succession of beams continues. Our guides tell us the districts of the city under which we are passing and the numbers of the streets. We are in the hotel quarter. We are now under the millionaire quarter, and now under Central Park we take a turn. When we are told this it surprises us in the profound silence that reigns. The procession of beams ceases. In this part the work is not finished. We creep now along the tunnel, which is quite bare, like cockchafers in a telescope. It gets colder, and, in proportion, less comfortable.

"At last there is a halt. There is a slight maneuver and the car goes on again. This time it runs into the open under the sky. It is the northern part of the island—a district which has not yet been altogether settled. Tired of being so long underground, it shoots upward and runs along a viaduct. Some furlongs further on is the terminal station—a provisional one. In time the net will be extended and the rails will run to the confines of the city.

"They will traverse by a tunnel the arm of the sea which separates these districts from Brooklyn; they will pass above the river which checks them at the north; along its passage the 'Metro' will stretch out transverse lines, ransacking this encumbered piece of land and turning aside a good portion of the human herd which every day in larger numbers crowds itself into the cars and wagons. The first line has cost about \$35,000,000. It is easy to

calculate what its working and its maintenance will cost, and as far as the income is estimated it is already being discounted.

"And thus there will be involved in this corner of the world, where electricity is accumulated without cessation and where you can feel its environment of a thousand currents, a little more of that mysterious and redoubtable force. There is not an inch of ground here which does not hide its cable. Cables are everywhere—in the air, swinging from roof to roof; under the pavement, where the clasp of the tramways seizes them; above the sidewalks, where the arm of the trolleys grazes them. When one realizes what this vortex of fluid electricity means, animating thousands of machines, lighting millions of lamps and causing its wreaths of wires to vibrate without truce or respite, one begins to comprehend the kind of commercial frenzy which shakes this city, whose inhabitants are rushing madly toward an ideal of dizzying riches."

American Fishes Found the World Over.

NOT only are American manufacturers found the world over, but fishes that are natives only to the waters of the United States may be caught in the streams of the principal countries of the world. Long Island oysters can be had in the waters of Argentina, American brook trout are served fresh from the waters of Ireland, and American travelers in New Zealand, Italy, Germany and France can obtain from the streams of those countries black bass that is native only to the United States.

The foreign governments are rapidly finding out that the fish culturists of the United States are way ahead of those of any other nation in the scientific propagation of all water species. Knowing also that this is a generous government, they feel free to ask for specimens of our best fishes for planting in the waters of their respective lands. Hundreds of thousands of fish eggs and small fry are shipped from the stations here to European and South American countries, and, in fact, to governments all over the world. No charge is made for the fish and eggs other than the cost of transportation.

As a usual thing the Fish Commission delivers the freight to the steamship agents of the country to which it is to go, at New York City. Last year about 700,000 eggs were sent to Ireland, Wales, Germany, Switzerland, Tasmania and Brussels. Twenty-five thousand brook trout eggs were shipped to Ireland, and 50,000 lake trout eggs; 20,000 steel-head trout eggs and 10,000 land-locked salmon were sent to Wales. A large number of yearling-spotted catfish were shipped to Brussels, in care of the Minister of Agriculture.

Commissioner Bowers received a letter the other day from the head of the Fish Bureau of the Italian Government, telling of the success that attended the introduction of American black bass and sunfish into that country some five or six years ago. Both have thrived wonderfully, and now are classed as important commercial fishes in Italy. Different species of the American bass have been introduced into a great many European waters, as well as crappie and sunfish. Some of the rivers of the Old World have become depleted of fish, and it is found that specimens from the United States are harder and more prolific than the native species.

One of the men connected with the Fish Commission here was commissioned by the Government of Argentina a year or so ago to go down there and superintend the establishment of a hatchery. About six months ago a large shipment of Long Island Sound oysters was sent to the same place. American catfish, rainbow trout and bass are plentiful in the waters of New Zealand, and Englishmen who can afford it make trips to that country for fine fishing.

How American Buildings Are Cooled by Water.

OF much interest to dwellers in warm climates is a description of a system for cooling the interior of buildings recently given by Alfred Siebert, a prominent American authority on all questions of artificial cooling, in which he advocates the use of water as a medium and points out its advantages over chemicals, ice and refrigerating machines. Application has been made for a patent to cover the system described.

The simplest and cheapest method, according to Mr. Siebert, is to use the heating coils, if an indirect heating system is in use. This means that air is blown over the coils placed in the walls and ceilings by means of a blower or fan and conducted to the rooms by ducts and registers. All that is necessary then is to connect the pipes supplying steam or water to the coils of the water-cooler, or of any other means of refrigeration, with the proper amount of valves interposed. The change can be made at any time.

Many of our readers in warm countries will appreciate the force of Mr. Siebert's argument, when he says it is not advisable to use brine or ammonia direct for cooling the air, even if they are used for cooling only. Brine will corrode the pipes, and ammonia pipes may leak and cause smell in the rooms. Furthermore, brine or gas might have a temperature below the freezing point, and then condensation will form on pipes and coils, which is a great loss and causes dripping, or will freeze, reducing the cooling capacity of the pipes and again cause loss of refrigeration by using part of it for congelation.

Locomotives for Japan.—One of our big American manufacturers is completing the last of the fourth order of locomotives for the Japanese Government, and they will be shipped within the next few days. The locomotives are intended for use on the Seoul-Fusan Railroad in Corea. About 100 small engines have been built for Japan by this concern since the war with Russia began.

No. 708. Two and one-half inch openwork gilt frame, showing pearl oil painting on glass. Size of glass, 10 x 20. \$10.20 net, per doz. Variety of subjects.

"IDEAL" Steam Cookers

FREE Book of 36 pages, printed in colors; handsomely illustrated; tells all there is to know about steam cookers—round or square. The 1904 models of "Ideal" Steam Cookers are entirely new in principle, design and special features. The only steam cookers made in which both round and square have whistles to call the cook when water is needed. Seamless copper tank bottoms.

Cooks a whole meal over one burner, on gasoline, oil, gas or common cook stove. Reduces fuel bills one-half. Agents wanted.

We Want Foreign Agents, and to get them quickly, we are making the following liberal proposition for this month:

No. 20, Sq., Copper Tank

Retails \$6.50 Each.

13-gallon food capacity. 12 Cookers in a box. Measurements and weights of boxes holding 12:

Gross weight, 210 lbs.

Net weight, 144 lbs.

Cubic feet in 12—28.

\$39 doz., f. o. b. N. Y.

No. 6 Round Cooker

Retails \$5.00

10-gallon capacity. 12 Cookers in a box, nested, solid. Measurements and weights, 12 in a box:

Gross weight, 150 lbs.

Net weight, 120 lbs.

Cubic feet in 12—11 1/2.

\$33 doz., f. o. b. N. Y.

These are our best sellers, but we make thirty different sizes of Cookers. Boxed ready for steamer. Order direct or through export house; in latter case, mail duplicate order to us to avoid errors.

We manufacture a full line of Kitchen Specialties and Blue-Flame Wickless Oil Stoves.

TOLEDO COOKER CO., 2301 Albion St., Toledo, O., U. S. A.

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing,
Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering apparatus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, so that prompt delivery can be made.

"NEW JERSEY" COPPER PAINT

LEADS THEM ALL,

So Our Testimonials Say.

We guarantee this Copper Paint to be the easiest to apply and, owing to its being so finely ground, it is the smoothest paint in the market.

Highest Medals from National Export Exposition and American Institute, New York City.

New Jersey Yacht Red Copper

For Yachts. Brightest Color Made.

New Jersey Seam Paint,

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.

Type "R" Sparking Dynamo for Gas Engines.

The Elbridge Electrical Manufacturing Co.

ELBRIDGE, NEW YORK, U. S. A.

TWO SPECIAL OFFERS FOR EXPORT ONLY.

Type "R" Sparking Dynamo.

PRICE, \$15.50, f. o. b. New York, Boston or Philadelphia.

Owing to the special construction and winding of this machine NO SPARK or INDUCTION COIL IS NEEDED, and a LARGE, BRIGHT SPARK IS ALWAYS OBTAINED at the breaking of the circuit. The Dynamo will never "lie down" when short-circuited, and will always increase its output at the moment when the spark is obtained.

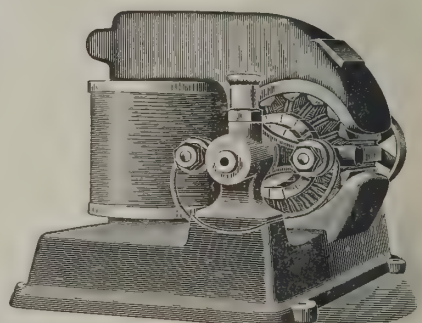

The Type "B" Dynamo or Motor.

PRICE, \$26.50, f. o. b. New York.

Output: As a Dynamo, 8 lights or 450 watts; for Electro-plating, 6 volts and 50 amperes; as a Motor it will deliver 1/2 horsepower.

This is a GOOD machine and will give the best of satisfaction. Standard voltage, 110, but can be wound to order for any voltage up to 500 at special prices.

Our Illustrated Bulletins mailed postpaid.

"FOR THOSE WHO WANT THE BEST."

Fiberlite Shade and Holder.

Shade made from fiber similar to that used for lining sockets. Mottled green on outside and pearl gray inside. Fiber finished under pressure which gives it a gloss finish, furnishing fine reflection for light. So tough that edges will not break and so springy that it cannot crush. Holder of heavy wire; one piece, clamps to socket with a catch. One catch and no screws. Fastens to inside of shade and any tendency to pull off only makes it hold more securely.

Light as aluminum shades, which means cheap freight rates.

TO INTRODUCE ABROAD:

Upon receipt of \$40.00 in U. S. gold or its equivalent, we will box and deliver f. o. b. cars at New York, five gross of these shades in assorted sizes.

The VAN BIBBER ROLLER CO.

CINCINNATI,
OHIO, U. S. A.

VAN BIBBER'S "ROUGH AND READY" ("El Tosco y Listo").

PRINTERS' ROLLERS

For ANY climate, hot or cold, can be made at once by any printer. You can make the best rollers, as hard or as soft as you please. No roller can be better. "Rough and Ready" does not spoil from age. English and Spanish directions. Price, 35c. List per pound, 77c. List per kilo, f. o. b. New York. Being an unfinished composition, the rollers when made cost less than this. Send to us for pamphlet. Used since 1878. We are manufacturers who sell at first hand and invite correspondence from prominent foreign dealers, to whom we offer special inducements; or, if you prefer, order through Amsinck & Co., American Trading Co. or any other responsible New York exporter.

Printers' Roller Composition.

"They Sound Different" For Violin, Guitar, Mandolin, Banjo, Harps, Etc.

BELL BRAND
STEEL and WOUND
Musical Strings.

Carefully and accurately made from tested materials of superior quality. The product of the most modern type of American machinery and skilled labor. Specially packed with reference to climatic changes and thus kept free from rust and tarnish indefinitely. For Tone Qualities, Strength and Beauty of Finish they are unequalled. Samples and Prices on application.

Don't Buy Without Reading Our
Incubator Book.

First of all, get this book. No matter what other makers you write for a catalogue, write us, too. We will send you the best book of all—written by the man who has devoted 22 years in perfecting RACINE HOT-WATER INCUBATORS AND BROODERS. When you learn what he knows you will want his machine, we think. The book is our illustrated catalogue—that is why we send it free. But it is more than a catalogue. It tells all that an incubator should be and why. Write to-day for it. Reliable representatives wanted. Prices quoted for export admit of big profits. Address

Racine Hatcher Co., Box 217, Racine, Wis., U. S. A.

Incubators

THE BEST THAT SCIENCE
AND MONEY CAN PRODUCE.

"SUCCESSFUL"

The **"SUCCESSFUL"** is regarded by those who have made money out of poultry raising as the greatest egg-hatching machine of the day. Heat, moisture and ventilation controlled automatically. Hatches well in the hottest and driest climates of the world. The walls of our machines are built on the refrigerator plan and packed with mineral wool asbestos. Sizes from 54 to 400 eggs. Prices from \$10 to \$37. Both hot-air and hot-water heating systems used. All hot water tanks made of 14-oz. planished copper.

A reliable representative wanted in every foreign country who is prepared to purchase a supply of incubators and brooders. Catalogues printed in English, French, German, Swedish and Spanish. Send for either Catalogue. Address

DES MOINES INCUBATOR CO., Dept. 611, Des Moines, Iowa,
or Dept. 611, Buffalo, N. Y., U. S. A.

**Gem Incubators**

Are low in price, but this does not mean that they are cheaply made, or that they are inferior in any way. In fact, they are high grade in every particular and have several important features not to be found in any other hatcher.

Prices reasonable. Results guaranteed. Send for beautiful illustrated catalogue, mentioning this paper. Reliable agents wanted. Address

GEM INCUBATOR CO.,
Box A1, Dayton, Ohio, U. S. A.

A HATCHING WONDER

The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17 1/2 inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

CYCLE HATCHER CO., Salem, N. Y., U. S. A.

200-Egg Incubator for \$12.80

The simplicity of the Stahl Incubators created a demand that forced the production to such great proportions it is now possible to offer a first-class 200-egg incubator for \$12.80. This new incubator is an enlargement of the famous

WOODEN HEN

recognized the most perfect small hatcher. This new incubator is thoroughly well made; is a marvel of simplicity, and so perfect in its working that it hatches every fertile egg. Write for anything you want to know about incubators. Send for the new free illustrated catalogue.

OUT-HATCHES ITS COMPETITORS!

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.

**355 Eggs
354 Chicks**

That's the result Mr. Geo. McDowell, Chemung Center, N. Y., obtained with an

IOWA ROUND INCUBATOR

The incubator that rounds out the largest number of chicks per hatch every time. If you are sure of your eggs you can rest assured of the same number of chicks—strong and healthy—with the Iowa Incubator. Catalogue and prices free on request.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

75% OF YOUR PAINT BILLS SAVED BY THE USE OF OUR PAINTING MACHINES AND READY=MIXED COLD=WATER PAINTS

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.

THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the LOUISIANA PURCHASE EXPOSITION amount to something over 12,000,000 SQUARE FEET, all of which is practically completed at this writing, and at least 95 PER CENT. OF THIS WORK WAS DONE WITH THE MACHINES WE BOUGHT FROM YOU. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

WE TAKE PLEASURE IN STATING THAT, IN OUR ESTIMATION, YOUR MACHINE IS FAR SUPERIOR TO ANYTHING ON THE MARKET.

THE COLD-WATER PAINT USED AMOUNTED TO ALMOST 400,000 POUNDS.

Respectfully yours,
BUILDERS' CONTRACTING COMPANY.

No. 3 "Rapid" Painting Machine.

Our Ready=Mixed Paints

are made from pure minerals, ground with a liquid chemical into a thick paste, which only requires the addition of water to be ready for instant use.

Our Ready-Mixed Paints are

**WASHABLE,
WEATHER-PROOF,

No. 5.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the Only machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

SEND FOR CIRCULAR OF OUR NEW MACHINES, WITH PRICES AND ALL INFORMATION.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

VOSS BROS. MFG. CO.,
DAVENPORT, IOWA, U. S. A.

ONCE SOLD, THEY NEVER COME BACK.

THERE IS NO FRICTION.
NO LOST MOTION.

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has **Revolving Steel Ball Gearing**, reducing the friction and thus making the machine so **light running** and **almost noiseless**.
 2. The tub is made of **Louisiana Red Cypress** lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
 3. The wheel turns right or left, **pin-wheel or dasher reverses automatically**, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
 4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
 5. The tub has a wringer box, fastened with steel brackets.
 6. The lid on tub closes tight, no escape of steam.
 7. Has glided hoops, castings and name.
- Prices quoted F. O. B. New York. Each **O. K. Washing Machine**, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

THE ROBBINS & MYERS CO.,
SPRINGFIELD, OHIO, U. S. A.

"The White Lily Washers, Wash Lily White."

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is 2½ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Upon receipt of **Thirty dollars** (\$30.00) in U. S. gold or its equivalent we will box, ready for transportation abroad and delivered F. O. B. cars at New York City, **Six (6) White Lily Washing Machines.**

Weight, 600 lbs. Measurements: 18x24x24 inches.

WHITE LILY WASHER CO.,

MANUFACTURERS,
DAVENPORT, IOWA, U. S. A.

[Founded by Root & TINKER, 1877],

WITH WHICH IS INCORPORATED

THE AMERICAN MAIL AND EXPORT JOURNAL.

[Founded by HOWARD LOCKWOOD & Co., 1877.]

THE JOHN C. COCHRAN COMPANY, - - - Publishers
Bennett Building, New York.

Published on the 1st of each month.

Subscription, to any part of the world, \$2.00, or an equivalent sum in any other currency. Single copies, 20 cents each. Advertising rates on application.

FOR UNIVERSAL PEACE.

MORE than ordinary interest attached to the twelfth annual conference of the Inter-Parliamentary Union held in the World's Fair city of St. Louis last month. From Europe there came more than two hundred legislators who are interested in the pacification of the entire earth. There was also a peculiar fitness in holding the sessions in the Exposition city, for there could be seen the great results accomplished in upbuilding a territory acquired by the United States by peaceful purchase and not by armed conquest.

The delegates commented with much favor upon the refusal of the President of the United States to act as arbitrator in the recent Venezuelan dispute and commended him for suggesting that the claims against Venezuela be referred to The Hague tribunal for adjustment. It was brought out in the course of the proceedings that more than two hundred cases have occurred within the last century in which international difficulties have been settled by arbitration in one form or another. In these disputes the United States was a party to about seventy of those adjusted by arbitration.

Naturally the war in the Far East was a subject for discussion, and the delegates united in deploring the enormous loss of life and the injury done to the world's progress by the martial conflict now going on between Russia and Japan. In this view of the war the delegates certainly voiced a sentiment against wars generally which is becoming stronger and greater everywhere every year. Aside from the waste of life and property involved for those directly concerned, much suffering accrues to non-combatants and there are indirect losses to persons who have no direct interest in the conflict. Besides all this, war is opposed to civilization's progress, and is injurious to international trade and commerce. More power, therefore, to the good work which is being done by the Inter-Parliamentary Union.

AUTOMOBILES of American manufacture are now being shipped to almost every country on the globe. Great improvements have been made in this line of industry through the tireless energy and skill of American mechanics and the results of their endeavors are being found in increased sales not only at home but in the foreign markets where, until within a comparatively short time, the American automobile was looked upon as a curiosity. Our readers can better appreciate the growth of this branch of our export trade when we say that the value of automobiles exported in the last fiscal year amounted to \$1,895,605, being just double the amount exported two years ago. Not only have our mechanics made wonderful improvements, but our manufacturers have given a decided impetus to the foreign trade.

SMALL PROFIT, LARGE SALES.

MERCHANTS abroad are interested in the *fact* that our exports are greater than ever before only because it gives evidence to them that previous purchasers of our manufactured articles, particularly agricultural machinery, have found our goods durable, suitable for the purposes intended and reasonable in price. If American merchants did not give good value to their customers abroad they would lose trade, instead of reaping the rewards of the increase which has been so noticeable within this calendar year. Regular readers of THE AMERICAN EXPORTER are fully posted regarding the policy of American exporters, but new readers are added every month to our list and some of these may wonder why the demand for our products gathers what may almost be called geometrical headway. To our new readers we give the assurance, which the older ones have long since verified, that the American manufacturer is more satisfied with large sales and small profits than he is with the reverse. Experience has taught him that he can produce better results by selling 100 articles at a profit of say \$5 each than by selling five articles at a profit of \$100 each. In the first instance, the article comes into more general use, people see it, want it and buy it, increasing the demand and enabling the mechanics to work out new ideas in the way of improvement in which they would be hampered if they had only five machines to make at a time instead of one hundred.

The old saw that "practice makes perfect" applies to Americans as well as to everybody else. They get the practice in the carrying out of the American principle of "small profits and greater sales." Our machines are always trying to improve upon what their predecessors have done. Occasionally one may discover and perfect an innovation, but all the time hundreds of others are finding ways and means to perfect the smaller details of the work upon which they are engaged. A slight change in gear, perhaps not noticeable to anybody but an expert, some new way of placing bracing or some other apparently trifling alteration in previously accepted methods may improve the value of the machine, perhaps cheapen its cost of production, while all the time its usefulness is added to. This spirit of advancement, of unselfishness, of endeavoring to uplift the world generally, that permeates all true Americans, brings about the interesting disclosures made in the recent report of the American Department of Commerce. We never like to make comparisons, but the figures are official and they give facts that are of interest to everybody in the commercial universe. The report shows that four chief exporting countries, as from 1880 to 1903, have increased their "exports of domestic manufactures" as follows: The United Kingdom, 18.46 per cent.; the United States, 339.85 per cent.; Germany, 69.66 per cent.; France, 19.64 per cent.

This showing is certainly wonderful. We would scarcely believe it ourselves if it were not based upon official statistics. The figures in detail are given on another page. We do not usually print statistics, but some of our foreign readers will undoubtedly wish to know more about the matter than what we wish to say in this portion of the paper. Not for a long time has there been a better opportunity to verify the adage regarding "cause and effect," nor has there been a better illustration of the practical utility of the American principle of "large sales and small profits" which within the last few years has been the motto of all American exporters who are fortunate enough to have the indorsement which goes with the publication of their announcements in THE AMERICAN EXPORTER.

ECONOMY of operation, a strict attention to details, persistent effort to excel and honesty of purpose are among the reasons which have given such great impetus to the trade abroad in American manufactured articles, especially agricultural implements and machinery of all descriptions.

MANUFACTURERS of agricultural implements in this country have recently placed large orders for steel on account of the increased demand for their products.

MACHINERY DAY at the American World's Fair last month was a complete and notable success. We have described the attractions in previous issues of THE AMERICAN EXPORTER.

MET WITH HEARTY WELCOME.

SEPTEMBER and the World's Fair at St Louis brought to America thousands of foreign visitors—most of them distinguished men in their spheres of life and all of them notable in one way or another. There has not been such an influx of men of the kind from other lands in many years—in fact, not since the Columbian Exposition at Chicago—and the gateway of New York saw in September alone a far greater number of these men than crossed the ocean to visit the Chicago Fair during all the months that it was a world attraction.

Columns could be written about our distinguished visitors. They are the bright men of nearly every important field of industry and endeavor everywhere on the face of the globe. They came to America to learn the latest and most improved methods as applied to the subjects in which they are interested. The St. Louis World's Fair, with its wonderful attractions, interested them greatly. New ideas occurred to many and new ways of applying old principles no doubt occurred to others. The men who are high in industrial manufacture, in fact, in any sort of mechanical or other progressive effort, are generally deep students. They find that the longer a man lives, if he is of the go-ahead kind, the more he has to learn. The day of the man who knows it all has long since been relegated to the dismal past. There is no room for such a man anywhere in these days of progress.

We were greatly pleased to note the interest with which our visitors viewed all things American. They gathered impressions of our greatness that cannot fail to be of importance in the extension of international trade trans-oceanic commerce. Many learned men among our visitors were astonished to realize the progress which has been made in every way in this country even since the Chicago Exposition. The impressions which they will take home will be no less valuable to this country, than they will be to the welfare of the world at large. The St. Louis Exposition has unquestionably exercised a world-wide influence for advancement of industrial, commercial and artistic education.

WOMEN IN TRADE.

ONE feature of American progress which may seem amazing to some of our foreign readers will nevertheless prove of more than passing interest to them. It is the introduction of women into business life and the advancement which some of them have made in fields that were formerly occupied exclusively by men. It is now not uncommon in America for women to be admitted to the bar as lawyers and in the medical profession women are graduated as physicians with a frequency that now no longer causes astonishment. Even in religion, there are now two denominations, the Unitarian and the Universalist, which ordain women as preachers. But it is in trade that women have lately attracted more attention than in the learned professions.

Progressive, ambitious, energetic and masterful, women have worked their way ahead in many important business houses, until they have gained the ascendancy. One of the largest chemical works in the world is managed by an American woman, whose executive ability and grasp of the affairs of business is certainly wonderful. In other cases the same degree of success has been achieved by women who have had the courage and the inherent gift of "knowing how" to do things. The American business woman is seldom handsome of face, she is of the retiring type and believes in attending to her duties with the same fidelity and energy that characterizes the course of the successful man in trade. She expects no favors or extra courtesies on account of her sex, and, taken altogether, she looks upon business life from the same point of view that the man does.

The old belief that women did not possess the ability to do men's work is rapidly passing away. The woman in business is a success only if she has the proper temperament, the necessary ability and the brains to do what is necessary. She must be able to excel man in the same line or she cannot go to the top. There are many notable examples of women's success and there will doubtless be many more of them in the near future, for the world of opportunity is daily opening more portals through which women with business brains may pass onward to success.

POLITICS AND TRADE.

OUR foreign readers care mighty little as to who is the President of the United States. THE AMERICAN EXPORTER is not a political paper and ordinarily nothing of a political nature would be allowed to appear in its columns on the subject, but there does seem to be something of more than passing interest in the phases of the Presidential campaign which is now in full progress and which will be decided early in November. These Presidential campaigns come once in four years and until this time have had a serious disturbing effect upon domestic trade and incidentally upon foreign commerce. Merchants, manufacturers and exporters of divided political opinions have hesitated to go ahead with new projects, or to materially increase their business, until they found out whether the "Democrats" or the "Republicans" would win at the polls. We have the "Prohibition" party, the "Socialist-Labor" party, the "Populist" and other parties, but somehow or another either the "Democrats" or the "Republicans" win.

This year both of the chief parties have put in nomination candidates for President who are of such a high degree of ability and availability that the expected depression has amounted to practically nothing. Our manufacturers and merchants feel that it will make no difference to them whether President Roosevelt or Judge Parker is elected. President Roosevelt has been tried in the position and Judge Parker has had extended service in public life and is of the temperament that would make him a good President. The entire country feels safe in the selection of either man. Of course, our American readers have a well-defined idea of the outcome, but we are not writing for *their* information, nor will we make any prediction as to the result.

Speaking of result, we are brought to the point which is of real interest to our foreign readers. No matter who is elected President, the policy of the United States during the next four years will continue to be friendly to all of the other countries on earth; renewed efforts will be made to establish and increase commerce, and in legislation, efforts will be continued to equalize unnatural conditions, while the principle of being fair and honest will be a lighthouse for our law-makers. Americans are not exclusive, nor are they hoggish, if we may be permitted to use such a vulgar but expressive word, yet they are enterprising and progressive. Whether they be manufacturers or ordinary workers the feeling is in their minds, and shows itself in everything that most of them do, that they desire to excel in whatever they undertake to do. Of course, there are exceptions, but the exceptions in America more than prove the rule—for they are so few.

For the next four years we predict that the United States will enjoy in increased ratio the remarkable prosperity which it has been its good fortune to have within recent years and the advances that will be made in trade methods, the improvements that will come from the activity of American inventive minds and the increased efficiency and superior durability of our manufactured products, cannot fail to tend to the advantage of our readers in other countries.

IT may not be many years before American farm implement makers will be confronted by a new proposition, according to information which we have received. The excellence of our agricultural implements has attracted so much attention in one country, Russia, that some of the progressive men are thinking about establishing a plant to manufacture duplicates of our products, buying American machinery for the purpose and using American workmen to produce the goods. No greater tribute could be given to the worth of our agricultural implements, but it will be some time before anybody can buy these durable and useful articles to better advantage than they can in America—if, indeed, the time should ever come.

WATER curtains, as a means of protection against fire in theaters, were mentioned in a recent issue and we have received numerous inquiries on the subject. The water curtain was fully described in THE AMERICAN EXPORTER for June. The idea is not patented and there is nothing to prevent anybody from following the suggestions made in the article.

AMERICAN FAIRNESS.

AMERICA was brought into the Far East trouble in a new way last month. For the moment some of our newspaper friends foresaw international complications and all sorts of unpleasant consequences. The Russian transport *Lena*, badly in need of repairs, called at the American port of San Francisco, on the Pacific Coast, for the purpose of getting into condition to resume her functions as a part of the military and naval establishment of Russia. The motive of the commander of the transport was plainly to test the American enforcement of the neutrality laws, and he found that the United States was disposed to be fair to both sides, without extending unusual privileges to either; and carefully refraining from taking any steps which would violate the position so carefully followed by our Government of not even seeming to take sides in the controversy.

When the time comes to arbitrate for or negotiate terms of peace the United States authorities will be found ready and willing to do all they can to aid in effecting a settlement for peace upon a fair and proper basis. Our officials, however, will not intrude, nor will they do anything that does not promise to be for the best interests of both contending Powers—as well as for the future maintenance of universal peace and the increase of international prosperity.

Some merchants benefit by wars, but the majority suffer, and armed conflicts between great nations always leave behind great trails of loss of human life—as well as money—so that no believer in progress likes to see the results which inevitably flow from disputes of this sort. It is probable that the war between Japan and Russia will be the last in which any great Powers will figure for many years, if not the last war of the kind that will be recorded in history. Civilization is making rapid strides and the Japan-Russian war has shown the futility of resorting to such methods to settle disputes between nations. A victory to either side will be fraught with much greater loss than would have been involved in an adjustment of the matter by arbitration.

FURNITURE EXPORTS.

AMERICAN furniture in the export trade shows a steady and gratifying increase from year to year, although this branch of our foreign trade does not exhibit the phenomenal growth which is found in some other lines. Last year the total exports were \$4,555,411, a gain of \$101,000 over the previous year and a gain of \$430,000 over the year before that. Nearly half a million dollars of increase in three years is not to be despised. Our furniture manufacturers have much to contend with in satisfying purchasers in other countries, for the question of climate enters into the durability of furniture to a considerable degree. Our manufacturers, we believe, have been taking up this matter in a way that will soon greatly add to the foreign demand for American furniture. The furniture exports from the United States to British North America, where climatic conditions are less unfavorable than in some other portions of the world, have just about doubled in four years. Outside of the United Kingdom and Germany a generally increased demand is shown in Europe for our furniture. In desks, it is now generally conceded abroad that American manufacturers are at the head of the industry and in this branch of the business the utility and conveniences made possible by the improved American desks is causing them to meet with increased favor everywhere. Our furniture trade is destined, apparently to grow much faster in the future, especially with countries in the temperate zones.

ONE of the great American railroads, the Pennsylvania system, has no fewer than 44,950 stockholders. Quite a portion of the stock is owned abroad, but the number of foreign shareholders is small. Thousands of the shareholders are employees of the railroad, which is something akin to the cooperative idea.

KOREA'S future is of more than ordinary international commercial interest. When the Russo-Japanese war is concluded, this already important market will become of greater importance, and the new American trans-Pacific steamships will aid in developing its value not only for American exporters, but for traders generally.

OUR PRICES HERE AND ABROAD.

TARIFF discussions are only interesting when they show something of practical benefit to somebody, and the subject is rarely touched upon in these columns, but in the Presidential campaign now pending some facts are brought forward which are of value to foreign purchasers of American goods. In our July issue we quoted liberally from a speech made by Mr. Secretary Shaw, head of the United States Treasury Department, in which he pointed out how foreign buyers of American goods are profiting by low prices. Mr. Secretary Shaw's speech has naturally brought forth criticism, and one of the political parties is seeking to make capital of the so-called "discrimination in favor of the foreign consumer as against the American consumer." Garbled accounts of the controversy are likely to go abroad and a disinterested presentation of the situation seems to be a duty to our readers.

The workings of the American tariff laws, in several particulars, certainly *do* give the goods to foreign consumers at lower prices than precisely the same articles can be bought for at the point of manufacture in the United States. This is an anomaly that requires explanation and the facts ought to be made perfectly clear. No business man, on the face of it, believes that a merchant would sell the same *quality* of goods to a stranger at a lower price than he would sell the goods to a friend and neighbor. As a matter of fact, the American manufacturer *himself* does not discriminate in the selling price as between the American and foreign buyer, but the foreign buyer in purchasing the goods benefits by the American tariff law in a way which many persons do not understand, for tariff writers are prone to delve in figures and juggle with tables of them in a way that is bewildering to all but students of the subject.

The real truth of the tariff is that as to many of our manufactured products, it enables American manufacturers to sell abroad, at lower prices, precisely the same good quality of implements which is required for the home market. This is due to the fact that many American products are composed largely, or in part, of imported raw material or unfinished material. On such material for manufacture as pays a tariff duty the American Government gives a rebate when the finished product manufactured from the same is exported for sale abroad. The finished product must necessarily be sold at home plus the duty, while abroad it is sold minus the duty. This is an easy, simple proposition and we hope we have made the matter plain to all of our readers. Figures are not needed to demonstrate the principle and exhaustive treatment of the tariff as a subject is not required to show our readers why they are able to obtain the lower prices.

The question naturally arises: Why does the United States continue to do business on a basis that apparently discriminates against the consuming class of the country? It may be said briefly that the country benefits by the employment given to hundreds of thousands of working people, whose wages would be lower than they are and whose purchasing power would be less, if they were employed less time and received the lower wages.

SOME of last month's South American visitors to New York were astonished to note the height of our buildings. One of our subscribers at Buenos Aires was whisked up in an elevator to our editorial rooms, which are not abnormally high. When he looked out of the window and noted the distance to terra firma he remarked: "You Americans certainly have great confidence in your men who put up buildings. I shall no longer be astonished when I read in THE AMERICAN EXPORTER about things that seem to me to be beyond belief." THE EXPORTER does sometimes print for the information of its readers items concerning new discoveries which seem incredible, but we are always careful to tell our readers what we think about the claims of the persons putting forward new ideas in any field of industry.

NEW YORK'S new subway is now considered one of the wonders of the age. Thousands of foreign visitors have inspected it and they are all delighted with the big tube.

A PEEP AT AMERICAN PROGRESS.

OUR readers are kept well informed regarding the progress which the business men of the United States are making in the matter of catering to the best interests of the foreign consumers of American products, but there are lines of effort pursued in this country which do not enter into export trade literature, but are nevertheless of interest to business men everywhere, aside from what may be shown in the matter of the higher commercial development of this country. One of these lines—comparatively new, but already well developed—is that of insurance engineering, which means that the subject of insurance has been reduced to an exact science in the United States, not only from the point of running insurance companies on a profitable and proper basis, but with a view to preventing the suffering and other than monetary losses that flow in the wake of all large fires. Conflagrations of great extent in area and enormous loss are becoming relatively fewer as insurance engineering adds to its efficiency, despite the wonderful increase in the size and population of our cities.

Some of the features of this decidedly valuable branch of American effort can well be seriously considered by our friends in other countries, not only as of prospective benefit to them in their own interests, but as of value to the welfare of the communities in which they do business. Several magazines are published in the interest of "insurance engineering," and the various matters coming under that head are treated with intelligent and exhaustive attention to the prevention of fires and the minimizing of losses due to that cause. Progress in this country in that direction is shown in the simple statement that in 1,500 out of about 4,000 American cities no roofs of wood can be placed on any buildings within the city limits. In cities thus safeguarded against the spread of fires there have been no real conflagrations. In other cities, which have not yet prohibited wooden roofs, the insurance companies are placing prohibitive rates upon structures not topped with standard metallic roofs. But roofs alone are merely incidental. Metallic window frames, concrete and iron in place of wood wherever possible, cement floors and many other similar points of construction, are being taken up in a way that foretells their early universal use.

In some of the great "skyscrapers" of New York, as some of the sixteen to twenty-four story buildings are called, one can go from basement to dome without finding an ounce of inflammable material used in their construction. In one of the big newspaper buildings in New York a few years ago a furious fire broke out in the paper room in the basement. An ordinarily-built structure would soon have been a mass of fire, and the occupants of the higher floors would have inevitably met an awful fate. As it was, they narrowly escaped suffocation from the smoke, but within an hour the fire was out, the printers and editors were able to return and resume their work, while the building was uninjured. The small loss, entirely confined to the paper consumed, was an object lesson of what improved building methods have brought about in the way of safety and prevention of monetary losses. There have been many other instances showing the value of the new idea, and its spread through America has been as rapid as it has been beneficial to everybody.

THE MACHINE TOOL INDUSTRY.

AMERICAN machine tools have long been recognized abroad as being of such excellent design and construction that there has been an enormous demand for them. A peculiar feature of this branch of international trade has been that a foreign demand has come for machinery with which to manufacture American machine tools. This phase of the situation is indicative of high tribute to the merits of our machine tools, and at the same time it has not operated to decrease the call for them abroad. In fact, the advertisement thus given to these products has been of incalculable value to the export trade in the field. The foreign consumer is quite as up-to-date as the foreign manufacturer, and he appreciates the indorsement conveyed by the latter's willingness to produce and sell to him American goods made with American machinery. Some of the consumers, perhaps more thoughtful than others, prefer to obtain the articles direct from the original manufacturers. Be that

as it may, the exportation of American machinery to make machine tools seems so far to have given that line of trade a great boom that is likely to continue for a long time.

It is gratifying to have the true worth of the American manufactured articles appreciated to the extent that is being shown, not only for machine tools, but for our agricultural implements, our typewriters, our engines and the numerous other articles coming under the general head of "manufactured products." It is evidence of the fact that our progressive manufacturing methods are favorably and profitably recognized abroad, and the continual increase in sales made by our exporters speaks volumes for the intrinsic merit of American goods.

IN the United States there are enormous plants employing vast armies of workmen. There is a limit to the domestic demand for iron and steel, so that it naturally follows, when the American market becomes overstocked the plants must either cease operations and throw their workmen out of employment or continue and dispose of the surplus product in some other way. Practically the only outlet is the European market, the key to which is low prices and in which last year we sold more than \$100,000,000 worth of iron and steel manufactures on an average of about four-fifths the prices charged to American purchasers of the same articles. This condition has led to the accusations of "dumping" made against Americans, but after all the foreign buyers benefit by anything of the kind that is being done and the American plants are kept busy, enabling our workmen to earn more money with which to help along not only domestic trade, but to spend for luxuries, money which in part goes back into the pockets of foreign manufacturers who send goods to this country.

SILK is one of the American industries that has made rapid strides within the last decade or two. This country has long since passed others in the quantity manufactured, and now uses annually about 14,000,000 pounds, or more than one-third of all the raw silk produced throughout the world. But, we would like to ask, is there *any* American industry that is not now operated upon the lines of success?

AGRICULTURAL education is one of the features of American endeavor. Not only have our inventors and manufacturers contrived to produce marvelous machines and other implements to till the soil and take care of thrifty nature's gifts to man, but the farm boy is now educated in his future vocation with the same care that the city juvenile is prepared for journalism, the medical, the legal or any other profession.

STRUCTURAL steel has become an important element in recent years in the American metal industry. It is largely employed in the construction of the myriads of new buildings that are being erected in all parts of the United States, and the export demand is growing in a gratifying way, for our friends abroad are beginning to show greater appreciation of the improvements which have lately been made in materials for the construction of buildings.

ELECTRICAL machinery of American make is now in use in even the most remote portions of the globe. Plants in far away India and in some of the inaccessible regions of Africa, saying nothing of other more generally favored localities, are using our dynamos, our wiring appliances and the electrical power, light and telephone systems that go with the development of this industry.

CANADA and the United States are again cooperating for the protection of the salmon fisheries. The question is of importance to foreign consumers of North American salmon, for without joint action by the two Governments the supply will be decreased and the prices advanced beyond what ought to be paid for this article of food.

INCREASINGLY large orders are reported for American typewriters in the export trade. The machines we manufacture seem to fill every want of the user, and their comparative cheapness is something that causes wonder abroad.

WHAT IS DOING IN AMERICA.

American Cotton Fabrics for Export.

WHILE the Russo-Japanese war has seriously affected the Oriental demand for American cotton fabrics, it may interest readers of THE AMERICAN EXPORTER to know that the final outcome of that conflict, whatever it may be, is bound to give increased impetus to the spindles and looms of the United States. The immediate effect of the struggle in the Far East, so far as it relates to American cotton manufacturers, is deeply impressive. For a considerable period prior to the closing of the ports of Manchuria to American trade in 1903, American manufacturers sold in the Manchurian provinces and in China the enormous total of 36,000,000 yards of cotton cloth every month. The trade suppression as to Manchuria began in April, 1903. In the month following, our sales of cotton fabrics to Manchuria and China fell to 15,000,000 yards, and then began a progressive decline which has continued ever since, our latest figures being for November of 1903, in which month our sales to that whole Eastern world, with more than 400,000,000 of population, amounted to only about 1,000,000 yards.

From the figures quoted the reader may get the notion that the American manufacturer of cheap cottons is disheartened; yet nothing could be further from the fact. The Oriental market for the cheap cotton fabrics of the United States has only been blockaded, not destroyed. The consumers are there—hundreds of millions of them—and they are just as eager to buy the American cloth as the makers are to sell. Moreover, when peace is restored, no matter which belligerent wins, there will be an understanding—not negotiated in Tokio or in St. Petersburg—that there shall be an equality of privilege in all the markets of the Chinese Empire, including Manchuria, for the products of human industry. That is all the American manufacturer asks. He needs nothing more, he expects nothing less.

Therefore, as indicating the American expectation regarding the Oriental market for cotton cloth, attention is invited to a few facts concerning the spinning industry in the Southern States of the United States of America, where the cotton is grown, owned, manufactured and packed, and where most of the cheaper fabrics specially made for Oriental markets are woven. In Newnan, in the State of Georgia, one firm is installing 7,000 new spindles. In Marion, South Carolina, 3,000 spindles are being added to an already large mill. A large firm in Atlanta, Ga., is spending \$50,000 in machinery to enable the establishment to run both night and day. One of the most successful mills in the State of Texas is adding 3,000 spindles to its machinery, and a similar concern in the State of North Carolina is putting in 3,200 new spindles. The capacity of a year-old firm in the State of South Carolina is about to be doubled, giving it 24,880 spindles and 700 looms. A new mill just completed in the State of Alabama has 10,336 spindles and 300 looms. One of the best mills in the State of North Carolina, now operating 6,000 spindles and 100 looms, will shortly add 8,000 spindles and 500 looms, and a factory in the State of Alabama is receiving an addition of 11,200 spindles.

Canned Tomatoes.

SOME notion of the extent of the tomato-canning industry in the United States of America may be derived from the fact that the sixty canneries in the single State of New Jersey expect to place more than 5,000,000 cans of the product on the market this year. Inasmuch as this commodity is a considerable item of American exports it may interest foreign readers to know how the tomatoes are prepared at a first-class cannery. When delivered, in a thoroughly ripe condition, they are placed in buckets and transferred to huge revolving colanders, about five feet in circumference, and divided into several compartments, each capable of holding one or more crates of tomatoes. When the vegetables are dumped into the colander, it revolves and carries them into a tank filled with hot water. This is the scalding process to soften the skin and otherwise prepare the tomatoes for future handling. After being scalded they are emptied into buckets and carried into the shop, where dozens of women and girls stand at long tables doing the peeling and coring.

After this the tomatoes are again put into buckets and carried to another table, where women and girls sort them, throw aside the over-ripe produce and pass along the best to other women and girls who pack them into the tin cans. All the packing is done by hand, and more skill is required to insert the pulpy mass into the cans so that it will retain its original shape than would be supposed. From the packers the cans are passed to the weighers to see that each contains the desired quantity.

The girls who weigh the cans pass them on to young men stationed at a recently invented machine for putting on the covers. This machine is built on the principle of a powerful die cutter, and its advantage over the old way of "capping" the cans is that it does away with the necessity of soldering with the lead that so often trickles through in the operation. The capping machine is operated by a young man who works with a lever and foot press. An assistant places the circular tin top loosely on the can and shoves it along to the man at the machine; he places it under the drop and in a twinkling the drop descends and welds the cap permanently on the can. There is a small pin-head hole in the top; this is to allow the air to escape in the capping operation. After this the cans are placed on a conveyer and carried through a steam-heated compartment to the other side of the shop. This

serves to partly cook the tomatoes and at the same time forces out whatever air may remain in the tins.

After this process the cans are taken up by the tippers—the men with tipping irons who cover up the tiny orifices in the heads of the cans with solder. Then the tins are placed in big metal baskets and are dropped into vats of hot water, where they are allowed to remain for a few moments to complete the cooking process. This practically completes the work, for there is nothing more to do except place the labels on the cans and pack them in wooden boxes to be sent broadcast over the world. There is no waste product in the tomato-canning business; every particle is used in some way or another.

New Rotary Engine.

MECHANICAL experts in the United States of America are deeply interested in a rotary engine invented by William Hoffman, of Buffalo, N. Y., which some of their number regard as likely to bring about a revolution in the fields of industry, commerce and transportation. If the inventor's expectations are realized, railroad trains will make 120 miles an hour with less friction than at present, steamships will greatly increase speed and single cars will be run at lightning pace on steam or tram railway tracks, independent of trolley connections, all with much more economy than under existing conditions. On top of all that, the power in all kinds of factories will be produced at a much less cost in a much smaller amount of space than at present.

The feature of Mr. Hoffman's rotary engine is that it makes use of the expansion of steam, the engine being cut off from connection with the boiler supply of steam for two-thirds of every revolution made. That means great economy in fuel and steam. But Mr. Hoffman says that steam is not the only means of propulsion that can be used in his engine. He says he intends to make gas engines of the same type, exploding gas in the chamber in which steam is used. So it is hardly possible to realize the revolution which this engine will create, if it comes up to its inventor's expectations.

It is claimed by the inventor that the Hoffman engine can be utilized in every instance where a steam or a gas engine is used now. The absolute absence of vibration makes it especially desirable for marine purposes. It will reduce the space occupied by present engines in boats 75 per cent. It will reduce the coal-carrying space in boats 25 per cent. It will lessen the cost of construction of new ships, by doing away with the strengthening now put in to meet the vibration of the present type of engines. It can be utilized for locomotives. It will do away with the rack and tear of piston rods going in opposite directions, and locomotives with four-foot driving wheels can be driven at a speed of from 100 to 120 miles. Then the engine will be used in the propulsion of single cars. A salamanderine or flash boiler, heated by petroleum, and a fifty horse-power engine can be put on the front platform of a car and leave room for the motorman. The engine will be specially valuable in connection with the production of electricity. The demand for an engine of high speed by the electrical companies was what started the boom for turbine engines. The engine will work a great change in the factories of the world, in every place where a stationary engine is used. Then there are automobiles, launches and a thousand and one other things which will be affected.

Wireless Telegraphy in Fire-Signaling.

ONE of the latest and most promising adaptations of wireless telegraphy in the United States of America is its use in prevention of forest fires.

The need of forest preservation in America has only recently aroused the interest which it deserves. There has been long in progress a thoughtless destruction of standing timber in various States and Territories which, if unchecked, would soon denude vast areas of valuable woodland. This destruction is now checked in large degree by Federal laws relating to unoccupied lands belonging to the United States, and by State laws concerning State lands. The forest fire, however, is an element beyond the reach of human legislation, and consequently a fire service has been established in many States and in the territories of the United States having for its purpose checking of the wilful or accidental destruction of forests by fire. This service includes an organization of fire-wardens for given districts, with police power and authority to summon their neighbors to work in fire-fighting. These officers, who are paid by the Government, have methods of signaling from one district to another which are, as a rule, highly effective. Their efficiency in this respect, however, seems likely to be greatly increased by a system devised by the Secretary of Agriculture of the United States, which includes the wireless transmission of signals in case of fire on the Government forest reserves. Fire causes considerable destruction of valuable timber in these tracts, and it is the design of the department to arrange suitable signals, so that on an outbreak of fire the rangers may communicate the alarm and secure sufficient assistance to stop the destruction at as early a point as possible. This system will be arranged to cover all the important timber reserves of the Government, and is expected to result in a vast saving. The Weather Bureau, which is also in charge of the Department of Agriculture, is developing its system of wireless telegraphy for the transmission of storm-signals and weather reports, and it is expected that within a few years an extensive use will be made of this comparatively new means of communication for this purpose.

EVENTS IN AMERICAN PROGRESS.

Great Achievements in Irrigation.

UNTIL a year or two ago the Snake River desert in the State of Idaho, U. S. A., was one of the dreariest and most forbidding regions of the whole North American Continent. Nothing but sage brush would grow there, the lands were utterly worthless for grazing purposes and the only living creatures to be found were coyotes and poisonous reptiles. But the magic wand of science and American enterprise has touched the desert and made it to blossom, almost literally, like the rose. Engineers in the service of the Government, finding traces of fertility in the soil, chose the Snake River desert as a tract for artificial irrigation, under the new scheme for which Congress has appropriated several million dollars. At an expenditure of \$2,600,000, which has been set aside for the construction of great impounding dam and diversion canals, fully \$12,000,000 of taxable property will be created in this basin. Taking as a basis the last census agricultural figures for Idaho, the 120,000 acres to be reclaimed under this project will, when settled under irrigation, represent the latter value, while the annual earnings of the land will amount to about \$2,000,000. With this area cut up into 1,400 new farms, as is proposed by the Government, a rural population will be created of 7,000, which will bring with it an urban population of probably another 7,000, or 14,000 people.

The Snake desert basin when irrigated will afford an ideal example of Western stock raising under the humane and profitable method of winter feeding. On any of the great Western ranges the cattle are left to shift for themselves the year round, entailing, during the cold season, great loss of stock and always untold brute suffering. Around the basin extend vast stretches of unclaimed land, which must always remain useful solely for grazing purposes. The irrigation of this tract of over 120,000 acres will provide, through luxuriant crops of alfalfa, winter feeding for tens of thousands of head of stock. Where now one steer requires thirty or even forty acres for his support, under irrigation the forage from one acre will more than support and finish him off for the market. Idaho has already attained distinction as a fruit producer, although the altitude is a little too great for the best growth of trees.

In other irrigated sections of the State, apples, plums, apricots, grapes and melons reach a high state of perfection and command fancy prices. Men have become wealthy from the careful cultivation of twenty and forty acre tracts, and enough can be raised from five acres of this irrigated land, exhaustless in its deep fertility, to support a family in comfort. The irrigated communities of Idaho have become among the most prosperous in the world.

American Tests of Coal.

WHILE there is no need whatever of a government monopoly of the coal product in the United States of America, such as is now urged in England with regard to the superior steam-making coal of Wales, there can be nothing but approval for the extensive tests of coal qualities now in progress at the St. Louis Exposition. These tests are conducted by scientists of established reputation for the sole purpose of determining the relative values of coal from various deposits. All expenses of these tests, including cost of material, transportation and labor, are paid by the Government. The equipment, which is also free to those using it, consists of steam boilers, steam engines, electric generators and motors, a complete gas producer, with economizer, scrubber, and holder, beehive coke ovens, a vertical gas engine, crushers, washers, driers, bins, one English and one American briquetting press, with outfits complete. There is also a complete plant of boiler and engine testing apparatus, and a well-equipped chemical laboratory, where calorific determinations and proximate and ultimate analyses of each fuel are made. All this work is in the hands of specialists of long training. The samples to be tested are selected at the mines by experts sent out for the purpose. On arrival, part of the coal is put through the gas-making plant, part through the coke ovens, part tested under the boilers, and part goes to the briquetting machines. A 250-horse-power gas engine is located alongside of a 250-horse-power Corliss engine, and both connected to electric generators. The coal will be transformed into electrical energy by both the steam and gas processes, and the results compared.

Skill in Cheesemaking.

IF one were asked to explain the high quality of American cheese and the important place it occupies in United States exports, the correct reply would be something like this: First, excellence of natural materials; second, cleanliness, skill and watchfulness in treatment, and third, sound judgment and businesslike method in preparing the finished product for the market. The American cheese-factory of to-day is a model of neatness, system and skilled labor scientifically applied. In its operation there is no uncertainty as to results, no foulness and absolutely no waste—all by-products being utilized—the sugar of milk forming an important factor of infants' food and other elements serving as the base for pills, tablets and various uses in chemistry and medicine.

At an up-to-date American cheese factory milk, brought in clean, closed cans, each containing from six to twelve gallons, is emptied into a receiving tank capable of holding 600 gallons. This tank rests upon scales of thorough

accuracy. After the milk has been weighed it goes through pipes into the vats within the factory. Milk received at night remains in these vats till morning, the souring process which is constantly going on in milk being conducive to cheese-making, as is also the mixing, in the morning, of the sweet and slightly sour milk. Modern vats used in the cheese-making processes are the same in shape and contain about 7,000 pounds of milk each. Between the lining and the exterior portion of the vat there is a compartment into which hot water is piped from the engine boiler, and is kept at a temperature of 85 degrees or thereabouts, and serves to properly scald the milk. **Rennet**, a liquid made from the stomach of a calf, is used to coagulate the milk, a few ounces being sufficient for 1,000 pounds of milk.

After the curd has formed and has been sufficiently cut to liberate the whey, a small piece of it is placed upon a hot iron. If it adheres to the iron it is ready for the presses. It is then taken from the vats and placed in telescopic hoops, drawn out to their full height. Cheese capping cloth is placed within the hoops and the curd fills them to the brim, after which the cover is put in place and screws, capable of raising a building, are applied. The hoops telescope as the pressing process continues and the curd becomes cheese. When taken from the presses the cheese is taken to the dryhouse and placed upon racks. What is known as a gang press, which will press twenty or more cheeses at once, is often used instead of the individual presses.

The whey, which is the recement liquid from the cheese factory, goes by way of a trough to the sugar of milk factory nearby, and is placed in vats of 500 gallons capacity, where it is boiled. Next a small quantity of diluted sulphuric acid is added, which causes the casein and fat to separate and leaves the sugar liquid. The casein—the coagulated part of the whey—settles to the bottom, and the fat comes to the surface. The sugar liquid thus separated is emptied into tubs. Having been boiled down into a saline mass of brown color, it is ready to crystallize. Hard yellow crystals form about the sides of the tub and about a stick placed therein. The remaining liquid is again put into the vats to be boiled, and the crystals are removed by the aid of a hatchet and are placed in bins. They next go to the refinery. Here they are repeatedly boiled, crystallized and decolorized, and finally ground by machinery to powder form, when the product is ready for the market.

American Seeded Raisins.

UPWARDS of 50 per cent. of the grapes grown in the State of California, U. S. A., are now converted into raisins, and while this industry is but ten years old, it already affords employment for more than 15,000 persons. The raisins are dried and partially stemmed on the vines and then taken to the factories where they are seeded. The seeding is done entirely by machinery. Preparatory to seeding, the raisins are "processed," to use a technical term. First they are subjected to a dry temperature of 140 degrees F., after which they are chilled, and after being subjected to the latter process they become as hard and dry as a bean. Then they are in shape to go through the final process of stemming, which takes off the short stem remaining on the raisin when it comes from the packing-house. The raisins are then put through a rubbing machine, which has the effect to remove the short stem mentioned and leave the raisin in its simple form.

Then the raisin is subjected to a moist heat of 130 degrees F., which has the effect of making them soft and pliable. Then it is sent on to the seeding machine, where it passes between a pair of pure rubber rollers, and is then impaled upon a roll of small saws, which presses the seed out through the surface of the raisin. The saw roll, with the raisin thus impaled, revolves and passes over a flickering device, which whisks off the seed, leaving the raisin still impaled on the saw roll. The saw roll, still revolving, passes around until the seeded raisin strikes a series of fingers, which frees the raisin from the roll. The raisins then pass through a system of chutes, and are packed by girls in one-pound cartons.

Profit-Sharing.

ONE of the most extensive coal-mining companies in the State of Pennsylvania, U. S. A., has for four years maintained a system of profit-sharing which is highly successful. Under this plan employees of the company buy its preferred stock and pay for it at the rate of \$1 per month on each share. They have the privilege of withdrawing from their contracts at any time upon thirty days' notice, and when withdrawals are made, purchasers receive back the full amount of their payments, together with interest at the rate of 5 per cent. per annum. A new series of stock-purchase contracts begins the first day of each month. Since December 1, 1900, there have been 45 series of stock-purchase contracts, the first three of which matured on May 1, June 1 and August 1, 1904, respectively.

The association purchases the company's preferred stock on the market from time to time and dividends paid on the stock so purchased accrue to the individual purchasers, all expenses of the association being paid by the company. The earnings thus accumulated by the association during the first forty-five months of its operations, or up to July 31, 1904, aggregated \$106,516.30. These earnings are divided pro rata among all the purchasers who continue their monthly payments until contracts mature. At the end of the last fiscal year there were 1,020 holders of the company's stock among its employees, representing a total of 8,152 shares.

Preservatives for Steel Cars.—Several of the largest railway companies in America are applying the copper preservative process to all their steel cars.

AMERICAN ACTIVITIES TO-DAY.

Progress in Life-Saving Service.

SEVERAL recent American inventions are noteworthy as marking the furthest application of creative genius to humane purposes. One of these is an automatic life boat recently adopted by the United States Government for use in rescuing persons from ships wrecked or disabled. This automatic life-boat operates itself without oars or sails, and if it happens to capsize the engine stops of itself instantly. This point is important, because if it were otherwise the craft might run away and leave its crew struggling in the water. Instead it pauses promptly and the men are enabled to scramble aboard again. Like an ordinary life-boat, the automobile boat is self-righting and unsinkable. This new kind of life-boat has a heavily weighted keel, while at each end is a large air chamber. Though it may be upset, it is bound to turn right side up immediately because of the weight of the keel and the buoyancy of the air in the chambers. The rear chamber contains the engine, run by gasoline, to which is attached a propeller. When the boat is in use the machinery is operated from outside the air chamber, much in the same way as an automobile is run. Nothing could be more simple. The engine, of 27 horse-power, weighs only 40 pounds, and, of course, is neither visible nor in the way. It drives the boat swiftly through the surf, enabling the crew—and this is a very important point, indeed—to reach a wreck unfatigued and ready to employ, where it is most needed, the energy which might have been expended in laborious rowing. Many a time has it happened that life savers have arrived at a distressed vessel so utterly used up by their exertions as to be unfit for the urgent duty required of them. The automobile life-boat obviates this difficulty, but in case of accident to the engine is provided with oars and a sail.

Another American invention which promises to be of great value to the Life-Saving Service, but which is still under official tests, is an acetylene gas apparatus for illuminating the beach at night. It is intended to be used at the scene of a wreck where, in the night-time, the darkness is liable to interfere very seriously with operations of rescue. Sometimes the rescuers are forced to abandon work until dawn arrives. But this machine, which the Government may shortly adopt, throws a light so brilliant that every man on a wreck 500 yards off shore can be clearly seen. The illumination is almost like day, and a newspaper can actually be read with a telescope at a distance of 1,500 feet. Another important point about the light is that it has an extraordinary fog-piercing power—a notable advantage, inasmuch as so many vessels go ashore in foggy weather.

Equally important and morally certain of Government approval, is what is termed "the illuminated shot," which is designed to be fired over a wrecked or helpless ship in the same way as an ordinary shot with a line attached, such as is discharged from a sort of cannon on the beach, when a rescue is in progress. When the ordinary shot is employed it is not always possible to tell, from the shore, whether or not it has made a hit, and even the people on the ship may not know where in the rigging the all-important rope has landed. But the new projectile has four holes in its base filled with a slow-burning composition, and when the gun is fired the stuff is simultaneously ignited, causing the shot to give a light similar to that of a rocket in its flight. If the first one is seen to fail the aim may be corrected accordingly. But it should be explained, perhaps, that no kind of line-throwing gun is effective beyond 400 yards. When wrecked vessels are further than that off shore the life-boat must be used.

There is now under construction another American contrivance which seems worth while. It is a "throwing gun" made like a fowling-piece, which has a stock like a rifle and is meant to be held to the shoulder. The projectile discharged from it goes as far as the cannon shot, and, as it flies through the air, unwinds with great swiftness a cord from a stick. The cord is only a tough kind of twine, but when once communication with a vessel is established by this means it is easy enough to use the cord to pull aboard a small rope, and then a big one, on which, if desired, the breeches buoy may be rigged for the rescue of individual passengers, to be pulled ashore one by one.

The success of the new shoulder gun as used by fire departments in many American cities for getting a line over high buildings has suggested the possible usefulness of the same implement in the Life-Saving Service, and experiments to determine its value are now in progress. Still another device which is under consideration is the "boomerang life line," which is a piece of wood two feet long, shaped like an Australian boomerang, and designed to be thrown in the same way. To its middle is attached a brass swivel, with a strong light line carried on a spool so as to run freely. The spool, contained in a wire frame, is held in the left hand, while the boomerang is thrown with the right hand, horizontally. At is flies, it carries the line with it, the range being 150 feet.

Among various appliances for the Life-Saving Service which are still under test, two others are worthy of notice. One is a "life-saving belt," the other is a "life-saving globe." The former is a ring-shaped buoy, and the latter is a spherical tank of iron which accommodates sixteen people. The inventor of the globe got his idea from seeing an iron water tank afloat after a frightful wreck, on a rocky coast, in which he lost his entire family. It is an unsinkable affair, and cannot be capsized. Ventilation is furnished by a pipe at the top, and a sail and rudder afford means of navigating this curious contrivance. A number of human beings might live in it for weeks, with a

supply of food, which, it is to be hoped, they would have an opportunity to put aboard before being obliged to cast themselves adrift upon the cruel and treacherous ocean.

Particularly interesting is a giant match recently adopted by the Life-Saving Service for use when a light or a fire is wanted in a hurry. This match somewhat resembles a "vesuvian" on the end of a long stick. It may be ignited by rubbing the end on the waterproof box, or on any safety matchbox, but, once ignited, it will not go out. If blown out, it instantly ignites itself again, and it cannot be put out by dipping it into water. In short, it is an unextinguishable torch in miniature, easily carried in the pocket of the surfman when he patrols the beach at night with his lantern. The importance of being able to obtain fire promptly in life-saving operations along shore is very great. The surfman's lantern may go out. Or it may be impossible to build bonfires to serve as a signal to a wrecked vessel.

The value of this giant match was illustrated only a few months ago on one of the Great Lakes of America. A ship had gone ashore and the life-savers, robbing a near-by fence of a quantity of whitewashed rails, built with them a gigantic sign across the face of a steep bluff, reading: "Aid Is Coming." It was pitchy dark, but the sign was brilliantly illuminated by starting large bonfires under it, and the news that help was at hand encouraged the distressed people to wait for the rescue that presently arrived.

Advance in Automobiles.

WITH the steady advance of American enterprise in other branches of invention and construction, it is but natural that we should make corresponding headway in building automobile vehicles adapted to the conditions of our broad and complex industrial and commercial life. It is only within recent years that the American people have been aroused to the importance of good roads throughout the country, affording easy communication between the producer and the consumer of the life-sustaining staples. Now, however, many States of the American Union are spending generous sums of money in building safe and spacious public highways, and these splendid thoroughfares serve naturally to encourage the manufacture of automobiles. As indicating the advance of American energy in that direction, we are at liberty to quote the following expressions from a mechanical expert who has built and rebuilt more miles of street railway in the United States than any other living man, and whose accuracy of statement is vouched for in the highest technical circles:

"Five years ago there were no automobiles. During the last twelve months our automobile output exceeded in value all the locomotives built in America by \$20,000,000, and the industry is scarcely out of its infancy. The trolley car and draft horse will go together; there is no room in the crowded streets of our largest cities for either."

Growth of an American State.

THE rapid growth of American commonwealths is strikingly illustrated in the State of Texas, U. S. A. Texas this year has passed the State of Missouri in population, and there are now only four States that contain more people—New York, Pennsylvania, Illinois and Ohio. In area Texas is nearly a third larger than all four of them. At the present rates of increase of population Texas will pass Ohio before 1920, Illinois before 1930, Pennsylvania by 1949 and New York by 1950, and become the most populous State in the Union. If it were as densely settled as New York now is it would contain 41,000,000 souls, and when it becomes as densely populated as England or Germany it will contain 95,000,000. By the act of Congress admitting it into the Union the State may be divided into as many as five States whenever the people desire division, but division has never been seriously proposed.

Since 1860 Illinois has had more miles of railroad than any other State till this fall, but on September 1st Texas exceeded it, having now 11,517 miles of main track. The exports from Galveston are now greater than the exports from Philadelphia, Baltimore or Boston. Only New York and New Orleans make larger outbound shipments, and Galveston will exceed New Orleans in a very short time and become the second exporting city in America.

Texas produces about one-third of the entire American cotton crop. More wheat is now shipped thence than from both New York and New Orleans. Galveston is nearer the trans-Mississippi wheat fields than any Atlantic port, and the Panama Canal will bring it very much nearer than it now is to the Pacific ports.

America to Build the Greatest Battleship.

PLANS are now being prepared at the Navy Department of the United States for what is expected to be the most powerful battleship ever placed on the sea. The battleship will be of from 18,000 to 20,000 gross tonnage, but the most radical departure will be in respect to armament. Instead of, as now, arming the vessel with a main battery of heavy guns and graduating the rest of her armament from 6-inch rifles down to six, three and one pounders in her second battery, the new ship will carry only two types of naval ordnance.

Her main battery will consist of ten 12-inch guns, the heaviest now in use in the American navy, placed in turrets and in broadsides, and her secondary battery will be made up entirely of at least twenty of the new 3-inch quick-firing guns.

America's Future and Power.

IN a review of a new book just issued in connection with the "Political and Literary Annals of the French Academy," M. Hanotaux, a member of the Academy, whose reputation is international, has written a remarkable article on "The Future and Power of the United States."

"The great American Republic," he says, "is already high above the horizon of the commercial world. Its attitude is menacing. All eyes are turned toward it. One word will express its position, 'power,' and one word will justify it, 'organization.' Power is shown nowhere so much as in a mere enumeration of the elements which make up the present and future greatness of the United States. Its territory is as large as that of Europe. It has 90,000,000 inhabitants. It touches the world's two great oceans. Its climatic conditions range from tropical to arctic. All kinds of minerals, from gold to coal, are found in its mines, along its rivers, and in alluvial deposits.

"All kinds of plants, from the cedar to the hyssop, are there; so, too, are all kinds of animal wealth, from the whale to the bird of paradise. The articles of primary importance, iron, coal, cotton, cereals, all kinds of machines, from those harnessed to Niagara Falls to those which dress a hog in five minutes, are there. Above and over all, permeating the life of the people, is an active and fertile genius, a spirit of enterprise, an assiduity of labor, perfect liberty and equality of all the citizens. If these are not the elements of a people's progress and prosperity, what are? Here there is a vast army armed to the teeth for the arts of peace, and even for the arts of war, lifting itself beyond the oceans, not a month from the ports of the Old World, but a week. If one considers the question of freight, the United States is nearer to the Mediterranean than Liverpool is to Marseilles.

"To-morrow this colossal empire, master of the Panama Canal, will interfere in some way between Europe and Asia. It will control the commerce of the West and the East, for it will hold the principal way. Such, then, is its power.

"In the matter of organization the Republic rules by means of a voluntary discipline which watches over all the larger industries, which subordinates them to very careful calculation and to ripe reflection. It follows the materials of commerce from their origin up to the very last step in their manipulation or preparation for the world's markets. It combines the efforts of all, and it concentrates all the forces of domestic production for the purpose of pushing its products with an irresistible impulse upon the markets of the world.

"This is the discipline that organized the trusts, that created the enormous fortunes always associated with the labor whence they are derived, that is only one weapon more in the hands of the men of genius who know how to create them. This discipline has created a still more intelligently wielded and terrible weapon, the graduated tariff, continually changed to meet changed conditions, and modified to coincide with the progress of the country. Sheltered behind this for fifteen years the American Republic has been forging ahead with astonishing rapidity and success. The Republic knows what it wants and whither it is marching. It is well posted as to its resources and as to the resources of its adversaries. It opens and closes its gates as the stranger is considered useful or harmful; in other words, treaties of reciprocity must really be the means of reciprocal trade.

"The admission of immigrants, or in other words, the importation of labor, is as carefully watched as is the importation of goods. On the battlefields of international trade clever strategists have organized a trust vaster than any heretofore conceived, which binds the different States and the different industries therein. I refer to the great national trust, the tariff. Thus, at the beginning of the twentieth century, the United States faces the world as a most desirable market, on the one hand, and as an awful menace to manufacturing nations, on the other. The nation or the individual that will make any effort to establish vast commercial relations in the future must be prepared to measure forces with the two great elements of the Union's power—its strength, based on its resources, and its organization. To what conclusion will a careful study of those two factors lead us? Is Europe in general, and each particular power, doomed to inevitable and irremediable defeat?

"Is the battle that is to be fought hopeless? Will the prosperity and progress that have marked the American Republic's movements during the last decade or two continue until they obscure all else? In other words, are we to be confronted by an American peril more terrible and more pressing than the 'yellow' peril, one that is to wield against the Old World the weapon before which that Old World is to go down to irretrievable defeat?"

Industrial Harmony.

IT is the proud boast of the largest firm of locomotive builders in the United States of America, a concern whose employees at times number as high as 15,000, that it has never had a strike. No discrimination is ever made in favor of or against union men. All hands know that the latch-string to the head of the establishment is always out, and that any one, of whatsoever station, can secure a respectful hearing of any grievance he may have. It takes years of good faith before the workmen can understand that principles such as these are traditions of a plant, and if such traditions are to be kept alive they must be instilled in a sufficient number of men to form the backbone of the later element. It is a difficult matter to teach an old dog new tricks, so that the apprentices offer the most fertile field for the development of a good, loyal body of men. This establishment

has always maintained a system of apprenticeship, and the certificate of one of the proprietors who entered as an apprentice is evidence not only of the establishment of the system in the early sixties, but also as to its effectiveness.

Success of the Traveling Stairway.

THE moving staircase now in successful operation in many large stores and other buildings in America is a valuable addition to the means of reaching one floor from another. It is really an inclined floor, moving upon a series of small wheels, which, in turn, are operated by larger ones that might be called driving wheels. The surface of the moving floor fits to the surface of the horizontal floor so closely that there is no danger of a person catching his feet between the movable and stationary sections. Any one who wishes to go from the ground story to the one above, simply walks upon the incline, and, in less than a minute, is carried to his destination. He may remain still on the incline, or walk along it as he pleases. The motion is so uniform that there is no vibration or jarring; and so rapidly do the stairs operate that one of the devices in New York City will carry 2,000 passengers in an hour to a height of about twenty feet.

The driving wheels, around which the endless floor moves, are usually connected by belting to an electric motor or steam engine. About 2½ horsepower are required to carry 600 passengers an hour; and double this amount to carry 2,000 passengers. Calculations based on actual experience show that by the use of electric motors, it costs but 7 cents to carry 1,000 people per hour.

Typewriting by Electricity.

WHAT is said to be a feasible means of operating a typewriting machine by electricity has been devised by a citizen of Newark, N. J., U. S. A.

It has always been necessary to depress the keys of a machine sufficiently to throw the type-bar against the inking ribbon and leave its impression on the paper, this action releasing a universal bar, which allows the carriage to move forward one space as each letter is printed. This can now be done by the aid of the electric current. Each rod is connected with a little electro-magnet, and, as soon as the current enters any coil, its corresponding rod is thrown forward, just far enough to hook the lower end of it beneath the edge of the central disk. Just as this connection is made, the passage of the electric current through another electro-magnet depresses the disk, pulling the rod down, and striking the type-face on the paper as though it were done by the depression of a key with the finger.

To form the connection between the individual magnets and the operating mechanism, the writer wears a set of metallic thimbles on the finger, which are wired to the source of the electric current. The instant connection is made with one of the metallic plates on the keyboard, the current passes through the plate into the corresponding magnet, and thence to the disk in the center of the machine.

Profit in Old Tin Cans.

AN enterprising machinist in Baltimore, Md., U. S. A., has established a profitable business in a factory which is devoted to saving the tin in old tin cans, which he buys from junk dealers in hundreds of thousands. The machine used in this work is of a cylinder style, and is run by steam, gas or gasoline, and is of two horse-power. It is operated by two boys. One feeds the can at the front, the other takes out the cans at the back of the machine. The first boy puts the can into a round, revolving cylinder that holds eight cans. As the first can is so placed the engine is started, and it revolves the cylinder, making room for the next, and so on until the cylinder is filled. When the can reaches a horizontal position it is met by two saws that revolve around the can, taking off top and bottom at the same cut. As soon as the saws have finished their work, a brush passes through the can, cleaning it. The can is now taken from the machine and passed through a rotary cutting machine, which straightens and at the same time polishes it, so as to make it appear as a piece of new tin. In this way 30,000 cans are cut in one day by two boys. Now that the tin is back to its former stage, it is ready for the commercial world, and is placed in presses, where it is stamped into various shapes, as roofing caps to hold tar paper on, corners for berry crates, signs and numerous other articles. The tops and bottoms are used to manufacture sash weights.

Powerful Lifting Machine.

ONE of the greatest lifting machines in the world is in regular use in the extensive shipbuilding yards at Newport News, Va., U. S. A. It is utilized in transferring heavy portions of warships, such as armor plates, engines, boilers and guns from the wharves to their positions on vessels under construction. This machine is known as a circular derrick, and is operated entirely by electric power. It has actually raised a weight of over 150 tons, swinging it around a circle 147 feet in diameter. Loads weighing 70 tons have been lifted and swung in a circle of 207 feet. The derrick will lift the heaviest cannon to a height of 100 feet above the surface of the water, and yet its machinery is so simple that but two men are required to operate it.

MICHAEL'S LAWN SPECIALTIES

Have been on the market over 46 years,
and have successfully stood the test of time.

Our Motto Is: **QUALITY** in Every Instance.

New Michael Lawn Swing.

For grace, solidity and beauty the New Michael Four-Passenger Adult Lawn Swing has no equal. All parts are bolted or screwed. We use no nails except in chair slats. No tools required in setting up. We guarantee the New Michael Four-Passenger Adult Lawn Swing to be the best made. Opens and closes like a jack-knife. Contains about 20 cubic feet each, and weighs, each, 150 lbs.

Price, per half dozen \$30.50

Michael's Folding Rocker.

Is the neatest and best article ever placed before the people. Folds as shown in cut. Painted red or green, or natural wood finish.

Six Folding Rockers, crated, containing about 14 cubic feet; weight, 48 lbs.

Price, per dozen \$9.00

Michael's Lawn Settees and Folding Chairs.

Our Lawn Settees and Folding Chairs are the most practical ever placed upon the market. The curve in back is exactly right. Painted red or green, or natural hardwood finish. Six 5-foot Settees, crated, containing about 25 cubic feet; weight, 96 lbs.

Price, per dozen \$18.00

Six Folding Chairs, crated, containing about 14 cubic feet; weight, 30 lbs.

Price, per dozen \$6.00

NOTE.—The prices above quoted are f. o. b. New York City.

We also make the Michael Porch and Lawn Reclining Chair.

THE IOWA

AMERICA'S FORWARD MOVEMENT.

The Cotton Problem in Europe.

IN view of the enormous increase in the consumption of raw cotton in the United States in the last five years, the question of insuring the future supply of that staple for their mills has become a matter of profound concern to European manufacturers. Present conditions point to a time when the entire cotton product of the United States may be needed for American spindles and looms. The tendency in that direction has naturally excited grave apprehension among European economists, who see in these changing conditions the elements of an industrial revolution. The cotton question indeed is to-day a problem which affects all Europe and which many of the ablest leaders of Old World industry and finance are striving earnestly to solve. As an example of their efforts, special interest attaches to an address recently delivered by M. Paul Bourdard at a meeting of the French Colonial Cotton Association at Marseilles. In the course of his address, which has been brought to the notice of the Department of Commerce and Labor by Mr. Robert P. Skinner, United States Consul at Marseilles, M. Bourdard made the following significant statement:

"The entire world produces, 14,000,000 bales of cotton, of which the United States alone contributes 10,500,000 bales, or 75 per cent. Moreover, Americans are attempting, with activity and persistence, to monopolize the consumption of the raw material which they produce, and to this end they multiply the spinning and weaving mills of their country, augmenting the number of spindles and installing their factories alongside the cotton fields. The consumption of American cotton in the United States grew from 2,287,000 bales in 1893 to 3,908,000 bales in 1903, and the progress appears to have been much more rapid since then.

"It is evident that the French cotton industry is menaced by death within a brief period if means are not found to remedy this situation. In order to supply the 6,150,000 French spindles and the 108,000 looms the French cotton industry pays each year for the raw material necessary more than \$57,900,000, which goes to the United States, India and Egypt. But even under these conditions the French industry finds ways of maintaining its position.

"It would be different should the United States succeed in consuming all the cotton which it produces. The 300 French spinning mills and the 650 weaving mills, besides the dyeing and finishing mills, would then have to close their doors, thus throwing into the street, deprived of the means of existence, 250,000 laboring people and producing an economic crisis of which the consequences would be disastrous.

"This danger may be met very simply by the full utilization of our colonial territories naturally adapted to the cultivation of cotton.

"Three of our colonies at this time are particularly favorable to cotton enterprise. They are Soudan, Dahomey and Madagascar and its dependencies. After a long and careful study of the question the Colonial Cotton Association has defined its program as follows:

"To develop and perfect the culture of cotton in the colonies where the natives lend themselves to it, and in all those where this textile is found.

"To study the modes of ginning and pressing compatible with the nature of the cotton and the local resources.

"To study the means of transport, and to endeavor to cause them to be increased and cheapened as much as possible.

"To engage the growers to ameliorate the quality of their product by buying better varieties and to aid in the creation of purchasing centers.

"To distribute selected native seed or exotic seed in villages, in order to obtain more highly improved species."

The Wave Theory in Commerce.

IN the course of a thoughtful article on the world-wide extension of American commerce the New York *Sun* points out that our share in the trade of foreign nations is susceptible of illustration by a series of wave-lines, the force of which lessens as the distance from our borders increases. "The rule," says the *Sun*, "holds good with only a few comparatively insignificant exceptions. On our north line lies Canada, to whom we sell 60 per cent. of all her imports. Northeastward, Newfoundland comes to us for about 37 per cent. of her needs. Southward, our immediate neighbor is Mexico. She obtains from our market nearly 60 per cent. of her importations. Southeastward are Cuba, buying nearly 40 per cent.; Hayti, taking a similar percentage; Santo Domingo, taking 55 per cent., and the British West Indies, coming for about one-third of their imports. In the next trade wave to the southward there lie the states of Central America, giving us collectively about 27 per cent. of their trade. Colombia and Venezuela give us each about one-third of their business. Following down the west coast, the rule holds good with Ecuador at 20 per cent.; Peru, 12 per cent., and Chili, 8 per cent. Along the eastern coast Brazil gives us 9 per cent.; the Argentine, 10 per cent., and Uruguay, 6 per cent.; while the interior countries are represented by Bolivia's 1½ per cent. and Paraguay two-thirds of 1 per cent. Looking eastward, England gives us 20 per cent. of her trade; Germany, 13 per cent.; Belgium, 10 per cent.; Spain, 9 per cent.; France, 8 per cent.; Italy, 9 per cent., and Russia, 2 per cent. Westward, Japan gives us 16 per cent.; China, 11 per cent.; the Philippines, 12 per cent.; Australia, about 10 per cent., and British India, about 2 per cent. The regularity of all this is more than a curious coincidence. It is probable that it is a correct indication of American trade conditions. We are not yet trade hunters in an active and energetic way, and proximity to these markets appears to be a strong factor in

the trade which comes to us almost without solicitation. Facility of transportation is evidently likewise a factor. The situation is at least suggestive of large trade opportunities by a little extension of commercial activity which would increase the force and volume of these wave lines."

Saltmaking in America.

INASMUCH as the United States of America now leads all other nations in the production of salt—last year's output exceeding 20,000,000 barrels—the processes employed in the State of Ohio, which is one of the richest sources of that staple, are worth a brief description. Wells lined with casing pipe are sunk down into the veins of salt water, about 1,500 feet below the surface, the diameter of the wells usually being six inches. Brine containing 25 per cent. of saline matter is brought to the surface by forcing water down one pipe by means of pumps, this water coming up in a parallel one, bringing the salt with it. The forcing of the water is necessary on account of the specific gravity of the brine. After being brought to the surface, the brine is piped to wooden vats, 120 feet long and 15 feet in width. Then after being freed from sediment it is conducted to vacuum pans, where by means of steam pipes heat is supplied from within, the brine boiling and vaporizing at a temperature of 120 degrees. The brine is made to circulate freely within the vacuum pan. With the concentration of the brine, the fine grain salt leaves the pan and is carried in its slushy form to bins, where it is drained. Later, in revolving dryers it is subjected to hot-air blasts.

By means of the cooling tower upon the roof of one of the salt-making establishments the same water is used over and over again in condensing the vapor from the vacuum pans. Water once used is carried to the roof at a temperature of 120 degrees. It first enters troughs 10 feet above the roof, from which it is later distributed to the roof beneath. It is returned to this pan at a temperature of about 60 degrees. Modern methods have revolutionized saltmaking until now the best grades, it is said, often contain less than one-half of 1 per cent. of impurities.

Industrial Progress in New Orleans.

ON the list of American cities most rapidly advancing in commerce and industry a prominent place must be awarded to New Orleans, La., U. S. A.

In foundry work, for instance, reports show that this has been an unprecedented year, not only in the amount of business done, but also in the character and importance of the work undertaken. Castings and moldings, which were formerly done in the north at a much greater expense than could be done at home, have been made in the foundries in the city. The workmanship and finishing have been equal to that done away. Already some large contracts in the way of machinery are planned for the coming year. An increase of 30 per cent. is considered a conservative estimate in the increase of foundry work. Some firms which a year ago were doing a \$40,000 and \$50,000 business are doing twice that amount, and the prospects are bright for a still further increase during the coming twelvemonth. This does not limit the work simply to repairing machinery, but includes the constructing of machinery for the equipping of sugar mills, sawmills, dredge boats, etc.

No better indication of the growth of New Orleans as a port can be found than in the ever increasing amount of repair work which is done to ships and water craft of all descriptions. It is conceded that any repair work, no matter what its character, could be done to battleship, tramp steamer or steamboat at as low a cost as at any other port. New machines have been added from time to time to the workshops, with the result that their equipments are equal to any emergency which might arise in the marine service.

Use of the Telephone.

TO show how extensively the telephone has entered into use in the United States of America, it may be stated that one company in that country has in use as many instruments as there are in all Europe. Two years ago there were in the vast Russian Empire fewer than 40,000 telephones. There are now double that number in the single city of Philadelphia, Pa., U. S. A. In the last two years one company has installed in America more than 500,000 telephones, a growth of almost exactly 50 per cent. There is to-day a telephone for every 50 persons in the United States. In all Europe combined two years ago there was only one telephone for every 368 persons.

The telephone is rapidly superseding the telegraph in every direction, because it is quicker. Last year there were in the United States thirty-seven times as many communications by telephone as there were by telegraph. The mail system of the United States has been so vigorously extended during the past few years that letter writing has increased enormously. Last year more than 5,000,000,000 communications were sent by post. But the telephone is rapidly creeping up to these stupendous figures, for there were last year two telephone calls in that land of hurry every time three letters were mailed.

To Measure and Utilize Fog.

AN American meteorologist has devised an instrument to collect fog particles and condense them into liquid in a rain-gauge, the object being to measure fogs and show their value to vegetation in regions where fogs are frequent and the rainfall is slight. The theory is approved by scientists, but one of their leaders holds that it would be difficult to ascertain from the catch of the "fog screen," which has been contrived, what would be the deposit of fog in orchards or how much of the water falls to the ground in such a way that the roots of the plants may utilize it, and that the chief benefit which delicate plants obtain from the fog is probably the protection which the fogs afford against the heat of the sun.

Electric Locomotives on Standard Roads.

FOR suburban traffic from American cities, if not for longer runs, the electric locomotive is already a virtual certainty. One of the great railway companies whose lines radiate from the city of New York has contracted for thirty electric locomotives for passenger traffic on hauls of 30 to 50 miles. The biggest steam locomotive of this company has an indicated horse-power of 1,500, and can develop a speed of 60 miles an hour. The electric locomotives now building for the same system will weigh about 85 tons each, with an adhesive weight on the drivers of 67 tons, and will be capable of hauling a train of 500 tons at a speed of over 60 miles an hour. The locomotive will be a double ender, running equally well in either direction, and will have four motors of 550 horse-power each. The motors will have only two magnetic poles, instead of four, the usual number in railway motors, and the armature of each motor, instead of working through gearing, will be pressed solidly on the axle, having been previously assembled on a quill for this purpose.

Uses of the "Slot Machine."

WHAT is known in America as the "slot machine" is put to so many uses that its utility seems almost boundless. By dropping a coin of indicated value into a slot, one type of machine will serve the buyer with a quantity of chewing gum; another serves bars of chocolate; another serves postage stamps; another delivers a quantity of shelled nuts; another, with a combination of phonograph and megaphone, announces the correct weight of the person who steps upon the platform before depositing his coin. One type of machine contains a city directory which opens to the customer upon receipt of a cent; another produces a glass of iced water, and the slot principle has also been applied to gas meters whereby, when a certain sum of money is placed in the aperture, its equivalent in illuminating gas is made available from the mains, the supply being automatically shut off when the amount purchased has been exhausted. The newest use of the slot machine, however, is for serving prepared luncheons, and it is an unqualified success.

Pneumatic Tube in Postal Service.

PNEUMATIC-TUBE service for the rapid transmission of letter mail was formerly used in but one American post-office—that of New York City—but it is now gradually being installed in all cities of the first class in the United States. The power used is compressed air, the mail being transmitted in large, oblong boxes of leather, metal bound. Where hours have been required for the transportation of mail to and from the various stations, the pneumatic connections insure its delivery in minutes. Before the letter lying at the bottom of a mail bag received at one of the stations has been dispatched through the tubes, the first letter taken out of the same bag will have been assorted and started on its destination. Delays created by the accumulation of mail as well as by its slow transportation will be done away with.

Greatest Electric Power Station.

ONE of the most important of the various structures projected in the United States is the New York Edison Company's huge new power station, which is about to be built at an estimated cost of \$5,000,000. Upward of 10,000 tons of steel will be employed. The material will be rolled at the Carnegie Homestead mills and the American Bridge Company's Ambridge plant will complete the fabrication. The New York Edison plant will be equipped to produce about 112,000 horse-power. The machinery will include fourteen 5,500-kilowatt alternating current 40-cycle generators, to run at 6,600 volts each, to be directly connected to a steam turbine of about 8,000 horse-power capacity. Delivery on the steel will commence late in the spring, and the plant is expected to be completed by the last of next year.

American Exhibition of Motor Boats.

ARRANGEMENTS are being made for a great exhibition of American motor boats in connection with the annual Sportsmen's Show, which will be held in Madison Square Garden in New York, N. Y., U. S. A., from February 21 to March 9, 1905. It is intended that this shall be the largest exhibit of motor craft ever given in America, all the leading manufacturers of such vessels having agreed to take part in it.

Loss to American Fruit-Growers.—In the State of Georgia, U. S. A., this year more than 3,000,000 quarts of strawberries went to waste for lack of baskets in which to send them to market, and that, too, in spite of the fact that the number and output of the basket factories in the State were nearly 100 per cent. greater than in the year preceding. And notwithstanding the increased output of baskets, the price of quart baskets has advanced from \$2.50 per 1,000 in 1901 to \$5 per 1,000 in 1904.

Wood Alcohol from Yellow Pine.—Until recently it was not thought that yellow pine could be profitably used in the manufacture of wood alcohol, but careful experiments have shown to the contrary, and several extensive factories for that purpose are projected in the great pine belt of the State of Mississippi, U. S. A., one of them being already in operation. This means virtually the organization of a new industry in that State.

Nerve of the American Boy.

STRUCTURAL ambition as it appears in the United States of America in the erection of lofty edifices known as "sky-scrapers" has an influence quite unthought of in the beginning. That is, it develops courage, nerve, self-reliance and correct habits on the part of those employed in the work of construction. As an illustration, there is a boy 15 years old employed as water-carrier to the men at work on a lofty building in process of construction in the city of Dayton, O., U. S. A. He earns \$4.75 per day—really earns it—for, more than 100 feet above the street he runs about on the slender iron beams with the pail and cup, to refresh the men. The other day he met a workman on the same beam. This beam was probably not more than six inches wide, and the water boy stopped long enough for the workman to take a drink. The two stood poised in the air 100 feet or more from the paved street, and when the workman finished his drink, the water boy backed up the way he had come, while the workman advanced, and when they reached a point where they could pass, the workman went on to another part of the building. The water boy tripped gaily along, running and sometimes almost sliding from one upright to another, with nothing under him but a six-inch foothold to save him from a terrible fall.

Heroic Service for Humanity.

AMONG the unselfish and purely humane institutions of the United States there is none more beneficent or more effective than the Life-Saving service, which has for its purpose the rescue of ships, men and cargoes imperiled by the hardships of the sea. This service employs more than 2,000 hardy and experienced sea-faring men, divided into crews of six or seven men for each station, and these watchful outposts of humanity stretch from Quoddy Head on the North Atlantic to Cape Disappointment on the North Pacific, as well as along the shores of the Gulf of Mexico and the Great Lakes. Since this splendid system was established in 1871, the Life-Saving Service has attended 14,076 disasters, involving 102,474 lives, of which only one in 100 has been lost; while of property imperiled, to the amount of more than \$210,000,000, over \$166,000,000 has been saved. The cost of maintenance of the Service for the last year was \$1,721,727, which is less than one-fourth the amount of property saved during that time, and not so much, by \$200,000, as one-fourth the estimated cost of the latest type of battleship ready for service.

Completion of a Great Tunnel.

AFTER three years of labor, day and night, employing 1,000 workmen, the great Santa Susana Tunnel on the Southern Pacific Railway in the State of California, U. S. A., is completed. This tunnel, 8,000 feet in length, saves six miles of mountain climbing for trans-continental trains, and is the third largest tunnel west of the Rocky Mountains.

The tunnel is about thirty-five miles northwest of Los Angeles, Cal., and was begun in 1900. The work was prosecuted from both sides of the mountain, and at each opening was established camps to accommodate the workmen. Electric-light and air-compressing plants were installed in each camp. The drilling and hauling away of the debris was done by machinery driven by compressed air. The escape of air from the drills furnished fresh air for the men engaged in the work. So complete were all the arrangements that few accidents occurred during the entire work. When the two working forces met there was less than a foot difference in their lines.

Age Limit for Employees.

THE demand for young men in American industries is illustrated in an order issued to all heads of departments in the vast plant of the Carnegie Steel Company at Pittsburg, Pa., U. S. A., instructing them to employ no man over 35 years of age in certain departments, and extending the age limit to 40 in others. The rule does not apply to laborers. The order affects a large number of the most expert steel men. During the last few years numerous new steel plants have been erected and tempting offers were made to the old and most expert employees. In many cases the new offers were accepted. The recent reaction in the steel and iron industry left many of these plants idle. This, coupled with the universal resumption of the Carnegie mills in the Pittsburg district, enticed hundreds of these men back to their old homes, only to meet the discouraging statement that no man over 35 years would be employed.

Electric Aids for Actors.—In nearly all the newer theaters in America electrical appliances are put in the dressing rooms to assist actors and actresses in their make-up as well as to insure protection from fire by discontinuing the use of gas. From time immemorial actors have warmed up their grease paints and heated their curling irons over gas jets. The flame was surrounded by a small wire screen, to prevent wigs from catching fire. Just above the dressing table is a nickel-plated box, shaped like a flat cigar box turned on end. At the bottom are racks for holding and heating curling irons, and on top indented pans for melting grease paint and cosmetics. A little key at the side turns the current on and off.

Wage Losses in a Strike.—It is estimated that the recent strike of men employed in the building trades in the City of New York, N. Y., U. S. A., involved a loss in wages of \$3,320,000.

The Silver Manufacturing Co.

373 Broadway, Salem, Ohio, U. S. A.

AMERICAN AIMS AND HOPES.

International Arbitration.

INASMUCH as the President of the United States has announced to the representatives of the Interparliamentary Union, recently assembled in the United States, that he will shortly invite the great Powers to join in another conference at The Hague to consider additional measures for the promotion of international arbitration, it is interesting to note the progress which has been made in that direction since the first conference assembled at The Hague in 1899. The conference established the International Court of Arbitration, and the first two cases submitted to it were taken there on the initiative of the United States—the first involving a long-continued dispute between the United States and Mexico over certain church funds in what is known as the Pius Fund, the second involving the right of England, Germany and Italy to blockade the ports of Venezuela as a means of enforcing the payment of unadjudicated claims against Venezuela.

Shortly after the first conference at The Hague, the Boer war in South Africa began, the Filipino insurrection took an aggravated turn, and France had her difficulty with England about the Fashoda affair. But soon before the end of the Boer war, the five-year treaty of alliance between England and Japan was signed, which bound the two countries together in war, if either should be attacked by two enemies. Then came the extension of the Franco-Russian agreement to the Far East, and a renewal of the Triple Alliance of Germany, Austria, and Italy. Yet these were all military conventions as different in their purpose and scope from what the Tsar had proposed as was possible, and on February 8th, of this year, the war between Russia and Japan began.

But, while this terrific combat has been going on in farther Asia, Europe has been kept busy making treaties of arbitration and settlement of old difficulties, and the general movement toward arbitration has had a strong impetus. Turkey came to an understanding with Bulgaria and with Greece. Italy has made a new treaty with Austria. Just recently, Germany and Russia are believed to have settled the preliminary negotiations for a new tariff treaty that will do much to lessen friction between them. But the most important series of treaties has been that which England has concluded with France, Italy, Spain, and Germany, and that France has concluded with Italy and Spain, by which these countries are bound to submit to The Hague Tribunal differences which fall into certain of the commoner classes of international disagreements. Thus the Tribunal has become something more than a fabric of the egotistical dreams of the Tsar.

An agreement has been made between Holland and Denmark which is interesting because it is probably the first agreement ever reached between two independent nations by which they bind themselves to absolute and unlimited arbitration of their international misunderstandings. But the most important of all these treaties has been the Anglo-French treaty, not so much because of the settlement of many colonial and other difficulties, but because it has brought these two countries so close together and made such a good understanding between the two greatest sea and colonial powers in the world.

The obvious tendency of the agreements thus briefly outlined is toward a rearrangement of world power along lines which shall lessen the likelihood of war by making it increasingly dangerous to the nation which begins it. In other words, they mean that the great Powers are animated by a high desire to safeguard "commerce, the calm health of nations."

Wages in America and in Europe.

IT is an interesting circumstance that the last five years have witnessed not only a shortening of the hours of labor but a rise in wages, both in the United States and Europe, although these changes are more marked in America than in the Old World, wages being much higher and the working day much shorter in the United States than elsewhere. These facts are strikingly presented in a current report from the United States Bureau of Labor and Statistics. This report shows that the average working day for eleven trades—boiler-makers, machinists, brick-layers, carpenters, compositors, painters, plumbers, iron-molders, stone-cutters, hod-carriers and common laborers—is nine hours in the United States, eight and a half in Great Britain, ten in Germany, and between ten and eleven in France and Belgium. The average hourly wage of these trades in the United States is 35.1 cents, 17.3 cents in Great Britain, 10.5 cents in Germany, 13 cents in France and 6 cents in Belgium. In other words, wages are more than twice as big in the United States as in England, three times as big as in Germany, and nearly six times as big as in Belgium, which, in proportion to its size and output, is probably the greatest manufacturing country in the world. The American common laborer receives higher wages than the skilled German or French workman, and almost twice as much as the skilled Belgian.

The most significant fact about American wages is the purely arbitrary way in which they vary with trades which require practically the same degree of skill and ability. Brick-layers, for instance, receive twice as much an hour as machinists. Probably this difference is due to the activity of the unions in some of the trades in which there is such increase. For, in the European countries, there is very little difference between the wage-levels of the various trades, and the wages of common laborers more nearly approach the wages of skilled workmen than in the United States.

But the most important fact shown by these comparative statistics is the great superiority in the mechanical equipment of the American workman.

To Convert Peat Into Coal.

IT is claimed by an engineer living in Chicago, Ill., U. S. A., that he has devised a process whereby marsh mud can be converted into coal and made ready for market within half an hour after it is taken from the bog. According to a statement published in the *New York Herald*, peat treated by this process shows a heat efficiency equalling that possessed by the higher grades of anthracite coal. Chemical analysis has shown a combination of hydro-carbons and volatile substances giving thorough combustion; physical analysis has shown a specific gravity, in some cases exceeding that of hard coal, so that a ton of peat fuel will take no more room in the cellar than is required for a ton of coal. The peat fuel can be produced at less than 90 cents a ton.

There is nothing new in the idea of utilizing peat, the soil that covers thousands of acres of waste land throughout the United States to the depth of three or four to fifty feet, as fuel. The trouble has been to find a process economical enough to make it an article of commerce. The elimination of moisture in the raw product has been one problem. Another has been the compressing of the dried peat into blocks that would withstand the weather and not disintegrate in shipment.

These problems, it is said, have now been solved. A centrifugal separator for the removal of part of the moisture at a low cost and a drier that reduces the remaining moisture to approximately the percentage contained in anthracite coal, have overcome one obstacle. The other improvement, wherein the commercial value of the finished product rests, has to do with the compressor that packs the ground peat into blocks for the market. In the systems heretofore employed the peat briquettes have been formed by a fixed pressure, which has not given them sufficient density. By the system demonstrated here the density sought is obtained by a yielding pressure—an impact and a slide by a ram of great power.

This combines the atoms and molecules of the peat particles and gives them a chemical combination like that of coal dug from the ground. The sliding pressure, aided by steam heat on the outside of the cylindrical jacket through which the fuel cubes pass, also forces the natural tar and paraffine in the peat—six pounds of the former and two pounds of the latter to the hundred pounds—into a glazed exterior that renders the block impervious to moisture. Practical tests have shown that there is none of the waste, through smoke and escaping gases, in the use of peat fuel that attends the use of hard and soft coal. There were no clinkers and the percentage of ashes was much lower than with coal.

One of the most interesting tests was made with an ordinary cook stove. A fire was built with four pounds of kindling and six pounds of hard coal. A thermo-gauge was placed in the oven and readings made at regular intervals through a peephole. When the fire had died out and the stove was cool another fire was built with four pounds of kindling and six pounds of peat briquettes, and readings were again made. They showed that the average heat obtained was 10 per cent. greater with the use of peat, while the duration of effective heat was 20 per cent. greater.

The Largest Traction Engine.

WHAT is described as the largest traction engine in the world has just been completed by a firm in the State of California, U. S. A. The engine, of 125 horse-power, is 17 feet high and 15 feet wide from outer edge to outer edge of its enormous wheels, and can climb a 25 per cent. grade carrying 20 tons. The engine tanks hold 600 gallons of water, sufficient to last for a distance of six miles, and an additional 600 gallons can be carried on the front part of the first wagon. As many tanks as desired can thus be added, but, as their weight detracts from the hauling power, it is considered advisable to replenish the water supply every six or twelve miles.

Tests have demonstrated that this ponderous machine costs but \$18 a day for operation. Oil, coal, and wood can be used for fuel with equally good results, without altering the fire box. An oil-burning attachment is furnished when oil fuel is desired. To operate the train requires an engineer and fireman. When freighting in the mountains, however, a third man may be required to attend brakes when descending steep grades, and also to help load and unload the train. Engines of this type, but of smaller size, are used throughout California and the Pacific coast, in hauling logs, lumber, and other kinds of material, some of the large milling companies in that part of the country including in their equipment as many as five or six of them.

New Pleasure Vehicle.

AMONG the newest American vehicles is the auto-chair, which is called the successor to the automobile. It first appeared at the St. Louis Exposition, and, because of its convenience, neatness, and simplicity, at once sprang into favor. It is destined soon to be seen in large numbers on the fashionable streets and boulevards of New York and Chicago. By many this new type of vehicle is already proclaimed the automobile's successor. It can be manufactured much cheaper than the automobile, and for shopping and light usage it has no equal. The chair takes the form of a low phaeton without a cover. There are four wheels—two large rear wheels, and two small ones under the foot rest. All are pneumatic-tired. The seats are upholstered in cane like those in street cars. Behind the seat is a box which contains the batteries that furnish the motive power.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 3/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/2 inches deep and 32 1/2 inches long. Made of selected quarter-sawn oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of Lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent, on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warehouses, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

AMERICAN TECHNICAL ARTS.

Railroad with One Rail.

AMERICAN capitalists have organized the Monorail Company and are preparing to make practical tests of a new system of railroad having a single rail. It is known as the Tunis system and the following description of it has been prepared by the inventor, a resident of Baltimore, Md., U. S. A., where the tests will be conducted:

"The fundamental principle of the monorail system lies in having the center of gravity as close as possible to the weight-bearing tee-rail. When this condition is fulfilled there is but little lateral force needed to keep the car in an upright position. For this reason, and also to overcome resistance to the elements, the car will be built of steel covered with veneer or pressed fiber. This makes them strong and very light, and also places most of the weight within a foot of the rail.

"The Tunis monorail patent covers a long, narrow car, running on a single tee-rail. This is spiked to the ties in the usual manner. The car is held in an upright position by means of two angle iron guide rails overhead, on which run flexible overhead trucks on the top of the cars. It is practically impossible to remove the car from the track without taking the structure apart. By a system of springs attached to the trucks, these adapt themselves to any irregularities on the trolley bars.

"That the monorail will ultimately rival the present railroad system is obvious. Take for instance, the case of a car resting on two rails; where the center of gravity, of course, falls between them. In order to keep on both rails, with the car going at full speed, it is necessary that the car be very heavy. In the monorail the center of gravity is over the rail, and consequently the car can be built as light as is deemed consistent.

"The moment we solve the building of light cars that moment we find the cost of these cars reduced to about one-half, and the weight to about one-third. By reason of this reduced rate we are able to save on all items of construction and on account of the extreme lightness of the cars, grades will make but little difference in power, maintenance, or speed. The monorail car can be very light without interfering with absolute safety. This lightness means the consumption of less power at all speeds, lesser powers to climb grades and quicker control of cars on grades. There is but little more friction on a curve than on a straight track.

"It will be perfectly safe to run cars around 20-degree curves at a rate of 60 miles an hour, and on curves of 10 degrees or less at an average speed of 120 miles per hour. With the monorail it will be practical to operate trains on all grades during snow or sleet, with much more efficiency than can be obtained from any known type of trolley car.

"The means of locomotion will be electricity, and as the guide rails conveying the current are very strong, they will not break as trolley wires often do. For this reason high currents can be employed, using these rails as conductors without risk of danger to life.

"One of the disagreeable features of railway travel to-day is the oscillation of cars on the roadbed. In going around a curve the average car rolls and jerks until a delicate passenger experiences the effects of seasickness. All this will be done away with in the monorail cars, however, as the mechanism of the car and track is such that swaying and jerking will be entirely eliminated."

Compressed Air in Breaking Salt.

AMERICAN manufacturers, packers and chemists using large quantities of salt have had difficulty in handling that staple for the reason that when stored in large quantities it is likely to cake or harden, especially if the surrounding atmosphere is moist. When stored long in such places, in beds twenty feet deep, as is often the case in America, the salt becomes so hard that it has to be broken with picks or axes. Recently, however, a new device has been used to break the salt masses so that the material can be handled easily. The implement is a large boring tool operated by compressed air. The auger is mounted on a wheeled truck which is guided by handles projecting from the rear of the framework. The rear end of the auger revolves in a socket fitted into the framework, while the air is admitted to the socket from the hose which supplies it. When operated, the boring tool is pushed against the mass of salt, and the auger is set in motion; and in a minute or two—so rapidly does the tool work—a hole about five inches in diameter is made in the formation the entire length of the auger. Then another hole is drilled parallel with the first, and another, until the pile has been undermined, so to speak, when its contents can easily be broken out. The advantage of this method is seen when it is stated that two men can get out as much salt by the power method as two dozen men by using picks and shovels.

Theater Curtains Moved by Electricity.—One result of the search for safety appliances following the dreadful fire tragedy in the Iroquois Theater in Chicago, Ill., U. S. A., is seen in a combination steel and asbestos theater curtain, as stanch and fireproof as the proscenium wall itself, which has to be operated by electric power because of its excessive weight. The power apparatus for raising and lowering the curtain has proved so efficient and convenient that theater managers now wonder how they ever tolerated the old system of hand-power curtains.

The Life of a Locomotive.

MODERN economies have compelled American railway companies to compute the average endurance-period of locomotives as carefully as life insurance companies compute the endurance-period of the applicant for a policy. Taking a locomotive which has a normal career and wears out by use, instead of being destroyed by accident, its "life" value can be measured with reasonable accuracy by the results of experience. These results show that the active life of a locomotive is about twenty years, and that if the locomotive cost \$15,000 to begin with, at least twice that sum will be required to keep it in repair during that period.

Everything possible is done to keep the engine in commission, until at last a stage of decrepitude is reached that seems to preclude further repairs. At this point it is a question of "scrapping" the locomotive, or of selling it for about \$2,500 to dealers in second-hand equipment, who will repair it for about as much more and sell it to a logging or similar road, where it may do service for several more years.

An old locomotive is worth as scrap from \$500 to \$2,500 as the case may be, the difference being due to the availability of the various parts for further use as such parts. When the engine is turned over to the scrappers it presents a disreputable appearance, far removed from that of the days when its first engineer looked it over. Once dignified as "she," "old kettle" or "mess of junk" are now the most respectful epithets applied by those who have to do with its operation. Even in the days of scrapping, careful management guards against wastefulness. Steel, brass and iron are taken off separately; everything usable is saved out; and frames, axles and good parts are set aside for further use. What is left goes to the scrap bins and eventually to the foundry or the junk dealer.

Generally speaking, railroads prefer to sell their old engines and cars, if possible, and save the expense of scrapping, which naturally is considerable. That is why a number of concerns do a profitable business in old rolling-stock, and there is a demand from small railroads or self-contained lines for engines and cars which the trunk lines do not think it profitable to keep in stock.

Educating Engineers and Firemen.

ONE of the foremost railway companies in the United States has instituted a system of training locomotive engineers and firemen, which promises to be exceedingly useful alike to the company and its employees. Briefly described, the system is as follows: In the first year of his service, a fireman gets a book of rules, which pertain wholly to the mechanical and fuel phases of a locomotive. At the end of a year he is examined in the subjects contained in the book, and if he fails is dropped from the service altogether. A similar course is pursued the second year. At the end of the third year, he must attain an average of 80 per cent. in the three years' course. Before he gets a diploma as a qualified engineer, however, he must attain 100 per cent. in the subjects prepared by the examining board.

Rapid Track Laying.—A new track-layer is in use in railway construction in the United States of America which, with a crew of forty men, will lay two miles of track a day. The track-layer has a huge crane, sixty feet long, which projects forward over the road and hauls behind it a train of sixteen flat cars loaded with ties and rails. A continuous double line of the latter moves constantly over rollers and carries the ties with it. Both rails and ties are seized at the proper time by the machinery and placed on the road in front of the train, where they shortly form part of the track over which it passes. This device is said to be the most expeditious as well as economical track layer in the world.

Automobiles on the Farm.—With the increasing ease of farming operations in America the use of automobiles in agriculture is a foregone conclusion. An instance is found in a machine contrived by an enterprising farmer in Franklin County, Ohio, U. S. A. This machine, which has displaced horses in many lines of work, is an auto-traction engine so fitted that it can be hooked to two plows, a corn planter or other farm implements, and when occasion requires it can be converted into a wagon for hauling. It can also be used to operate a thresher, a pump or a drill. The engine of this machine is water-cooled. It is 10 horse-power, but the gearing is such that the actual power developed at the wheels is equivalent to 40 horse-power.

New Lining for Refrigerator Cars.—A new variety of lining for refrigerator cars recently placed on the American market is attracting attention for the reason that, while it possesses the insulating properties of hair felt, it combines the papers used in connection therewith, so that, instead of involving three operations, the new article can be applied in one. It consists of regular felting hair fastened to and enclosed by two layers of waterproof paper. Tests are said to have demonstrated it to be equal to hair felt. It is furnished in lengths sufficient to reach around a car, and wide enough to extend from the sill to the roof plate. This does away with joints.

Tested in a Practical Way.—In order to test a cultivator of his own make, an American manufacturer of farm implements recently placed his wife and 4-year-old child in the vehicle and substituted himself for a horse for a 300-mile journey. The trip was made successfully in three weeks, the owner, his family and the vehicle arriving in perfect condition.

Rat Trap.**"Out o' Sight"**
FLY STRING**LITTLE'S WONDERFUL COBWEB CARBON PAPERS.**

This product is unique in Carbon papers; its discovery an accident; its success immediate. For a long time after its first advent, the tissue paper upon which the carbon is made could not be procured. The mill declared it impossible to duplicate the shipment. The lot previously made was an accident. They had exhausted every facility of their plant to fill the order, with no avail. It looked as though the Cobweb was forever lost. Urged by Mr. Little, continuous experiment was made and finally the net result of a former accident was secured and the stenographic profession permanently enriched by the only carbon paper made that would produce from sixteen to thirty clean, clear-cut impressions at one writing. All machine company's tests for "largest number of copies" use Little's Cobweb Carbon Paper. It is very thin, extremely fervent, does not smut and will not deteriorate, under any ordinary circumstances, in any climate. *Age improves it.* Used and recommended for taking six to sixteen duplicate copies. Made in the usual colors.

Send for Catalogue. Orders received through New York commission houses at export rates.

AMERICAN PRODUCTS ABROAD.

American Cars for Argentine Railroads.

ONE of the largest, if not the largest, single orders for railroad rolling stock ever placed with American manufacturers was closed by cable on the last day of August. It comprises 640 freight cars for the Argentine Government railways. Another order for thirty-eight passenger, sleeping and baggage cars was closed at the same time, and was also for the Argentine railways.

Delivery of the freight cars will be begun next month and of the others in the early part of next year. The fact that these orders were secured in open competition with British, German and Belgian manufacturers may be regarded as a substantial recognition of the reputation enjoyed by American makers of these products in the markets of the world, and that reputation is by no means lessened when it is considered that the company securing the order for these freight cars had already furnished a considerable number of cars for the Argentine Government railways, and its managers believe the satisfactory work done by those cars had much to do with their securing the new order.

During the last two months there has been a decided increase in shipments of American railroad materials to foreign countries, especially of rails, many of which have been shipped from Philadelphia to the southern republic, where considerable work has been done in the last year or two. The fact that the United States is getting this business can only mean that American manufacturers are able to sell products not only of superior quality, but at a price low enough to secure contracts.

Reciprocity Treaty with Canada, Perhaps.

A WELL-INFORMED correspondent at Washington, the capital of the United States, says: "The remarkable change of front of Senator Henry Cabot Lodge, of the State of Massachusetts, on the subject of reciprocity with Canada, as evidenced by his recent conciliatory speeches in reply to the demand of Massachusetts interests for closer trade relations with the Dominion, together with the recent publication by the Department of Commerce and Labor of an elaborate monograph on the trade of the United States with Canada, have given rise to a great deal of speculation as to whether the Administration is planning to include a reciprocal trade agreement with the Dominion in the general scheme of tariff revision which, it is expected, will be undertaken by the Fifty-ninth Congress, to be elected next November.

"Notwithstanding our somewhat strained commercial relations with the Dominion Government, our exports to Canada have continued to increase, and the most conservative and far-seeing public men are beginning to feel that a reciprocity treaty with Canada will be necessary in the very near future to prevent the adoption of measures that would constitute a much higher barrier against American products than the existing tariff with its preferential rates in favor of Great Britain. In ten years our total commerce with Canada has more than doubled, amounting in 1903 to \$209,389,000, of which \$71,784,000 were exports to the United States, and \$137,605,000 imports from the United States. The increase since 1873 of the imports into Canada from the United States has amounted to over 188 per cent., while the exports from the Dominion to the United States have risen a little more than 70 per cent."

Peanut Oil.—All signs indicate an increased output of peanut oil in the United States this year. This oil is entering more and more largely into the manufacture of fine toilet soaps and also for use as a lubricant in America as well as in Europe. The meal that is left after the oil is extracted from the peanuts is sold for cattle feed, as which it is keenly appreciated. Marseilles is the great market of the country for the peanut oil and meal. Before pressing the peanut, the kernels are freed from the red cuticle by a winnowing process. Some Americans who have experimented in manufacturing the oil, pressed this red skin and the nut together and as a result the oil was extremely bitter. Often the nuts are subjected to three pressures, but the best oil comes from the first pressure.

Our Fruits in Demand Abroad.—Exports of fruit from the United States in the fiscal year 1904 will exceed \$20,000,000, against less than \$3,000,000 in 1894. The growth in the exportation of fruits from the United States has been very rapid during the last few years. Apples, oranges, apricots, prunes, and raisins form the principal items in the exports of fruits. The exportation of prunes from the United States has grown very rapidly. Germany, France and the United Kingdom are the principal customers for this class of American fruit. Raisins are also becoming an important feature of the export trade in fruits.

American Torpedo Boats, for Whom?—Mr. Lewis Nixon, a prominent American shipbuilder, returned to New York from Russia a few weeks ago and when he arrived it was stated in the newspapers that he had contracted to build several large warships for the Russian Government, but that statement was promptly denied. Since then the frames for ten torpedo boats have been laid in his shipyard at Perth Amboy, N. J., U. S. A., and it is said that frames for sixty additional are under construction. Mr. Nixon will not say for whom these boats are building.

Demand for Machinery in Japan.

A JAPANESE correspondent of the *British Trade Journal* writes to that paper that "as there are hundreds of thousands of Japanese forming an important section of the productive population now engaged in the war, Japan must rely more and more upon such members of the community as have hitherto been enjoying an idle life, living on the incomes of their families or on their family estates. Young and old must become producers and must be provided with some suitable occupation. This makes it imperative that Japan should improve its domestic industry, and putting away the time-honored ways of hand labor, utilize machinery in many branches of domestic industry. These include knitting, umbrella-making, envelope-making and similar occupations. Machines for this work are not only simple in construction, but easy to manage and clean to handle. Some of them can be worked by members of well-to-do families with considerable interest and profit. It is a great pity in our country that people above the middle class are in the habit of living idle lives on their family estates, but they will no longer be allowed to despise labor, and they will be bound to engage in business for the general benefit. When rich and poor all become producers there will be a stimulus to the use of all kinds of mechanical appliances adaptable for home industries.

"It is a question still unsettled whether the factory system is more suitable to the Japanese than the domestic or home industry method. From an historical, geographical and monetary point of view, the latter has many advantages, though it may be taken for granted that the former is more profitable. But even then Japan can to-day hardly compete in extent with the factory system of western countries. It seems preferable, therefore, to keep to their own system of home industry for the time being and to improve it by utilizing mechanical power. For instance, Japan's exports of porcelain, lacquered ware and Japanese paper increase year by year, yet they are at present made only by hand. The authorities concerned have now come to study the use of machinery in these branches of trade, and we hope they will meet with success. If machinery is imported for home industries our exports will be free from the defects of variation in articles made only by hand, and there will be less difficulty in carrying out large contracts."

Charles M. Schwab to Emulate Carnegie.

CHARLES M. SCHWAB, the American who made millions in steel, intends to emulate Andrew Carnegie and try to die poor. He recently told a reporter how he is going to get rid of his wealth. He thinks there is no essential credit in dying rich; said he was not qualified to talk about philanthropy, but was willing to tell how he expects to part with his fortune.

"You see," he went on, "it is a harder thing to spend money than most folk imagine—that is, to spend it in the right way. Industrial pursuits are my hobby, not only industrial schools for boys and girls of sound body, but where the cripples and deformed children may learn some useful occupation. I have observed during my connection with the steel industry that nowadays the young men have an ambition to get out of manual labor work with the hands and become engineers, electricians and professional men. The crying need of to-day is that young men be taught some useful work to do with their hands.

"I believe the time will come when industrial training will be taught in every public school. The State will take it up. I am a Roman Catholic, but I am a strong believer in public schools. I don't believe in parochial schools. Why, down in Homestead in the industrial school I established pupils from the parochial schools are not admitted. Boys and girls who go to schools are taught nothing but books; they don't get the opportunity to learn how to do things with their hands, that which will be of practical value to them in earning a competence.

"Our most useful men are not the ones with the most intellectual training, but those who know how to do something of some kind of work with their hands. Our best-educated men are those who started after going through school to educate themselves. When we combine education with a knowledge and desire to do manual labor we have the elements of success.

"Mrs. Schwab and I have spent hundreds of thousands—yes, millions of dollars—at Richmond Beach, New York. Never heard of that, did you? We did that very quietly. Our object was to teach crippled and deformed boys and girls useful occupations, but the storm of public criticism got so severe that we have decided not to do anything more just now. We'll start again some day."

Merely a Matter of Shoes.—The laying of the cornerstone of a new shoe factory in England a few weeks ago was made the occasion for a fine display of local pride, the mayor and other officials joining in the ceremonies. All of which is a reminder that the American manufacturer of shoes is so busy that when he wants to enlarge his factory he does it as speedily as possible, without fuss or frills. One of the leading American firms of shoe manufacturers recently sent out eighty traveling representatives with samples for the new season. Based on last year's records, these eighty salesmen will receive this season orders averaging \$100,000 each.

American Threshing Machine in Damascus.—An American threshing machine imported into Damascus by a rich Moslem landowner is paying large returns on the investment in rentals for its use among the peasant farmers.

Double Engine Traction

In THREE Sizes:

20 H. P. - Weight, 9½ Tons
 25 H. P. - Weight, 10½ Tons
 30 H. P. - Weight, 11¼ Tons

Boxing for Export will increase weight 20 per cent.

Hauling Capacity, = 15 to 25 Tons,
 BESIDES FUEL AND WATER.

These Engines Always Give
 Maximum Power.

They use
 Wood,
 Coal or
 Straw
 for fuel.

Where the reduced speed of a single engine will stall it, the Double Engine walks right along.

Wheels (22 to 28 inch face) shown are for Threshing and Plowing Traction.

Special Wheels
 for Freighting.

Boilers are of ample size. With indifferent fuel under severest stress will blow off.

Engines on "belt-brake" show easily 40 to 60 per cent. increase in power over above rating.

Representatives Abroad:

 NEIL CURRIE, Santiago, Chili
 MOFFAT, HUTCHINS & CO., Cape Town, So. Africa

WATEROUS, Brantford, Canada.

THE SAWYER TOOL MFG. CO.'S "SILENT ADVERTISER"

Consisting of a case, made of quarter-sawn oak, finely finished, about three feet wide, five feet high and four and a half inches deep. The glass door in the front opens, allowing easy access to the tools.

When submitting an estimate for one or more of our "Silent Advertisers," we select the latest, up-to-date and most salable machinists' tools, and charge the latest list price, less the regular trade discount.

The terms that we quote include boxing and delivery f. o. b. New York.

Our 64-page Catalogue, illustrating and describing the various styles and sizes of Fine Machinists' Tools and Hardware Specialties made by us, mailed postpaid, to all parts of the world.

An Excellent Method of Making a Practical Display of
 Machinists' Tools at a Small Cost.

SAWYER TOOL MFG. CO.

FINE TOOL MAKERS,
 FITCHBURG, MASS., U. S. A.

THE IMPROVED United States Cream Separator

WAS AWARDED

GOLD MEDAL (The Highest Award) at the Pan-American, Buffalo, N.Y., U. S. A.

GOLD MEDAL, Paris Exposition, Paris, France, 1900.

U. S. Separator, Dairy Size.
 Low Supply Can.

And the official records show that in the Model Dairy at the Pan-American its Work Excelled Everything, averaging .0138 for 50 consecutive runs, and won World's Record for practical every-day work.

The United States Separator stands without a peer, the most thorough Separator made.

Dairy size U. S. Separators run easily by hand, but can be operated by power if desired. Capacities range from 150 to 700 lbs. an hour.

Prices from

\$50.00 to \$165.00.

Large illustrated catalogues sent postpaid for the asking.
 Orders received through export commission houses.

Please mail duplicate order to us.

TENDENCIES OF COMMERCE.

Free Ports of Entry on the Isthmus.

THAT the United States Government is fully resolved to safeguard the trade opportunities that will arise from the construction of the Panama Canal is shown by the announcement of Rear Admiral Walker, Chairman of the Panama Canal Commission, that the United States will open and maintain two free ports of entry in the canal zone. One of these ports will be Cristobal, near Colon, on the Atlantic side of the Isthmus, and the other will be Ancon, near Panama on the Pacific side. It is intended that all goods meant for public or private use in the canal zone shall enter through these ports, the fiscal affairs of which shall be administered by the United States, with the understanding that no goods imported into the zone will be allowed to enter the territory of the Republic of Panama save on terms prescribed by that government.

The maintenance of a free port at each end of the canal is obviously a plan of commercial necessity. The construction of the water-way will involve the importation to the isthmus of scores of millions of dollars worth of materials and goods of every description, and besides that it will bring into the canal zone an army of foreign laborers over whom the United States is pledged to exercise supervision and police power. It is vitally necessary, therefore, to establish a system of administration which shall be simple, thorough, efficient and economical and so adjusted as to promote the development of trade while affording the amplest protection to the mutual interests of the United States and the Republic of Panama. An indispensable feature of such a system is a business-like control of the customs service at both ends of the canal which, in the very nature of things, must be exercised by the United States. Now, the cities of Colon and Panama were specifically excluded from the territory in the canal zone ceded to the United States by the Republic of Panama, consequently, in devising regulations for trade entering the zone the United States had to do one of three things. It could turn over the whole customs service to the authorities of the Republic of Panama, or it could adopt the equally anomalous and more difficult policy of enforcing American customs regulations in the foreign cities of Colon and Panama, or it could establish free ports of its own at each end of the canal. The latter course was manifestly the easiest and most practicable and the one best calculated to protect the colossal interests involved in the canal project. In adopting it the United States Government has insured a stable and efficient administration of the fiscal affairs of the canal zone and laid the basis of a commercial policy which is bound to contribute largely to the trade development of the isthmus.

Some interesting information as to conditions and prospects in the Republic of Panama is contained in a report recently forwarded to the State Department by Mr. H. A. Gudger, United States Consul General at the city of Panama. He estimates the area of the new republic at 31,500 square miles and the population at 300,000 including 40,000 Jamaica negroes, 2,000 Chinese and large tribes of Indians who are still in a state of savagery. The interior forests are rich in hard woods, and it is believed that the hills contain enormous deposits of valuable minerals. One of the greatest needs of the country is wagon roads leading from the coast into the interior. There are at present not more than twenty-five miles of passable roads in the whole country, and the construction of such highways is indispensable to the development of the natural resources of the territory. With the inflow of American capital, however, Panama is bound to experience a decided boom as soon as the work of canal construction begins in earnest. "From Panama and Colon," says Mr. Gudger, "there are various steamship lines running to the different ports of the world. The service of both ports is either weekly or trimonthly, and the lines operated by companies that are able to furnish the very best of accommodations to their passengers. It is confidently expected that a fast line of steamers will be operated between New York and Colon, and it is more than probable that another will be established between Mobile and New Orleans and Colon."

America's Invitation to Europe.

AS showing the sincere desire of American producers and manufacturers of cotton that their activities shall be properly understood in Europe, special interest attaches to the following resolution unanimously adopted by the American Bankers' Association in annual convention in New York City on September 16th: "Bankers from the cotton-growing States attending the American Bankers' Convention having heard that it might be possible to induce the cotton manufacturers of Great Britain and the Continent of Europe, either as an organization or as duly appointed delegates, to visit the United States and make a personal study of the cotton growing and manufacturing possibilities of the South, at a special meeting held for that purpose desire by this resolution to express their earnest hope that the spinners of Europe may visit this country this fall, promising on behalf of every business interest a hearty welcome."

Art in Shoes.

SOME of the new styles of women's shoes recently produced by American makers are particularly attractive. There are plum-colored ones, for instance, which are of the richest and most beautiful shade imaginable, and are accompanied by stockings which match so perfectly that no artistic eye will be hurt by a discrepancy such as sometimes exists between colored shoes and hosiery worn with it. Besides plum-colored shoes, there are lovely green ones, of the shade so fashionable last summer.

Coming Opportunities in China.

PROBABLY no other foreign country offers to-day, or will continue to offer for the next twenty-five years, such an attractive field for the exploitation of American enterprise as now exists in China. That ancient empire, with its 400,000,000 of population, is at the threshold of a tremendous revival, physical, industrial and military. In fact, the movement has already begun, and while it may be temporarily retarded by the Russo-Japanese war, it will be little, if any, affected one way or the other by the final result of that conflict. The events of the last ten years, including the war with Japan, the Pekin Relief Expedition of 1900 and the present occupation of the Manchurian provinces as the battlefield of foreign armies, have aroused China from the lethargy of centuries and given her for the first time in ages something like a coherent national spirit and ambition. When the indemnity claims now standing against her are settled she will have paid more than \$500,000,000 as the penalty of her own weakness and negligence. The enormity of that burden, which she is powerless to resist, has convinced China that her safety lies in a sweeping reorganization of her industrial energies, her military system and her business methods along lines that will enable her, unaided, to balk the aggressions of smaller but more progressive nations. This popular awakening to the need of adopting the ideas and policies of Western civilization is strikingly illustrated by the condition of railway interests in China. There are at present about 2,400 miles of railroad in the empire, counting the branches of the Trans-Siberian system in Chinese territory. There are 1,200 miles in process of construction, while concessions have been granted for 3,000 miles additional, and surveys have been made for upwards of 6,000 miles more. The construction of these lines will give added impetus to the intellectual and economic revolution now in progress in the Celestial Empire, and is bound to present attractive openings for American genius and enterprise.

The relations of the United States with China are exceptionally favorable to the extension of American trade in the Chinese market. Our Government has been the steadfast friend of China when she has most urgently needed friends. We have stood resolutely for her territorial integrity, for fair play in her behalf in adjusting the indemnity judgments arising from the Boxer troubles and for a policy which should, as far as possible, save her from the perils of her own political weakness, giving her time to adjust herself to modern conditions and be able to discharge her international responsibilities with honor and dignity. China is not insensible to her obligations to the United States. She will not forget them. On the contrary, it will be found, we believe, that the American seeker for trade will be specially favored and treated as the preferred caller in China from this time forward. It is to that ancient empire, now rapidly rousing itself from the slumber and superstition of ages, that we may look for the most splendid achievements of American commercial and financial influence anywhere beyond our own continental boundaries in the next two or three decades.

It is both interesting and instructive to observe the changes, intellectual and commercial, which have occurred in China in recent years. Only five years ago a large class of the natives loathed everything foreign. To-day those same people are engaged in a fierce rivalry to see which shall lead in adopting Western manners, fashions, inventions and methods. Bicycles are common around the Forbidden City in Pekin, and the Dowager Empress has not only committed the revolutionary act of riding in a carriage of foreign make but has gone to the startling extreme of purchasing automobiles for the use of the imperial household and having her portrait painted for exhibition at the St. Louis Exposition! The first railway in China, fourteen miles long, was built by Russell & Co., of Boston, in 1876, but the government soon bought it, tore up the rails and stacked them along the right of way because, as was officially explained, the operation of the road disturbed the spirits of the dead which are constantly moving about in the atmosphere. The telegraph lines were repeatedly torn down for the same reason until Li Hung Chang, then at the head of the cabinet, one day issued a circular giving notice that any person caught meddling with the wires after a certain day would lose his head. That did the business, and thereafter telegraphic communication was uninterrupted. To-day there is a new China, thrilled with an awakened spirit of nationality. She beckons and invites—because she needs—the American and his products.

An Unanswered Query.

HERE is a brief recital of experience which testifies to the superiority of rubber garments made in America: The writer, during a summer outing in northern Canada this year, had the pleasure of taking for a morning's fishing on a mountain lake a woman who is the wife of a gentleman prominent in the official service of Canada and who has a social position of distinction in England. Three or four miles from camp a violent storm arose, and the lady had the alternative of being rowed back to shelter or donning the writer's rubber coat—a light-weight branded "pure rubber." She chose the coat, and the rain bothered her no longer. The bass were striking ravenously, as they always do in that wonderful country, but she found time to say: "Why is it that the rubber coats, blankets, boots and shoes that you Americans have are so much better in every way than we can get here in Canada? Yours are not only better fitting, more thoroughly waterproof and more durable, but are far superior in pattern and finish." The writer modestly declined to attempt any explanation, but if the obligations of a guest in a foreign country had permitted, he would have replied: "Because they are made in America."

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices.

Our watch factory is the largest in the world devoted solely to manufacture of time-pieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES

Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

F. O. B. New York.

Catalogues and full information, also special discount for quantities, may be obtained through your commission house or direct from us.

One gross of watches packed for export weighs about 50 lbs. and measures 1½ cu. ft. Send all orders through your commission house and send us copy of same.

Largest Manufacturers and Exporters in the world of all kinds of

Coin-Operating Machines.

Our 80-page catalogue, just issued, profusely illustrated, in colors, describing the many styles of Coin-Operating Machines made by us, will be mailed post-paid to all parts of the world.

Nearly all our Coin-Operating Machines can be made to be operated by the coin of any realm.

All machines are boxed ready for steamer, and prices quoted will be f. o. b. cars New York or San Francisco. Orders received through export houses. When ordering through export houses specify MILLS NOVELTY CO.'S COIN-OPERATING MACHINES, and to avoid errors, please mail us duplicate of order.

INDUSTRY AND INVENTION.

Competitive Tests of Locomotives.

IN view of the fact that American locomotives are in use to-day on the railways of many Old World nations, and that they constitute a factor of growing importance in American exports, the trials of rival constructions at the locomotive testing plant at the St. Louis Exposition are matters of world-wide interest. These trials are in no sense spectacular, but practical and "strictly business," and the results are of permanent value to the leaders in locomotive construction.

In these trials the driving wheels of the locomotive under test run on smaller supporting wheels, whose axles are connected with absorption brakes operated by high water-pressure. The engine is attached to a draw-bar, which in turn is attached to a traction dynamometer. This dynamometer is imbedded in a solid concrete foundation. Instead of pulling a train, the locomotive pulls at the draw-bar. When the locomotive is fired up, and the throttle opened, its driving wheels begin to revolve. They turn the smaller supporting wheels, whose resistance may be increased by the absorption brake. The more power that is turned on the supporting wheels, the greater the work required from the locomotive to overcome the frictional resistance. The measure of this work—the work done by the locomotive—is made on the traction dynamometer, and is reduced to foot pounds. By means of delicate apparatus, the amount of pull exerted at the draw-bar is automatically recorded on rolls of paper.

But the amount of work done by the engine is not the only result obtained. Economy in coal and water is proved. The water used in the boilers is chemically treated, measured and purified; the coal is cleaned and weighed. By means of calorimeters attached to the engine, the amount of energy produced from the coal and absorbed by the water is accurately measured. Everything is, therefore, scientifically recorded.

The ideal conditions which govern these tests make it possible for all kinds of locomotives to be tested in the same way—measured by the same standard. Heretofore, the practical tests of locomotives were track tests, where the conditions varied with every test. During the Exposition American, German, and French engines will be tested.

Modern Machine Tools.

TO the student of modern mechanic industries the display of machine tools and processes at the St. Louis Exposition is a vertible revelation.

For machines working in metal there are those operated by shock, compression, or tension; steam hammers, trip hammers and drop forging; machines for cutting, sheaving, punching, stamping, counter-sinking and shaping; rolls, draw benches, wire drawing machines; machines for stretching and flanging and for bending, butting, welding and riveting. Another interesting sight is the methods of heating, annealing, tempering, cementing, welding and brazing, together with all the tools used with the forge and with the above named machines, as well as a full display of anvils, vises, hammers, shears, punches and dies, and various compounds for metal tempering, welding and cleaning. A full line of machines with cutting tools are on exhibition, such as machinery for drilling, boxing, reaming and tapping; machines for planing, milling, slotting, grooving and machines for grinding with grit, energy, carborundum and diamond. In the machine and forge-shop equipments are measuring tools and instruments of precision and for testing shapes and dimensions. Machines for working in wood are seen in every variety—for sawing, planing, turning, boxing, molding, mortising, tongueing, grooving, shaping and carving, as well as for polishing and veneering.

Uses of Electric Power in Farming.

ELECTRICITY is entering more and more largely into the operations of American Agriculture. Its advance is well illustrated in the condition of affairs in Kane county, in the State of Illinois, U. S. A., where the farmers are adapting electrical power to nearly all kinds of work. By the use of motors they are separating milk and cream, thrashing wheat, cutting corn stalks, sawing wood, grinding grain, pumping water, and lighting their houses, and are planning to plow, unload and bale hay, and haul their produce to market by electricity. There are now half a dozen big farms already equipped with electric motors and half a dozen more in process of equipment. The power furnished the Kane county farmers now using electricity comes from the trolley lines and the third rail electric railroad. It is poled in by short feeds to fifteen horse-power motors installed in small power-houses built contiguous to the barns. The voltage of the lines furnishing the power is 500. These farmers have experimented with gasoline, steam, and water power before turning to electricity. The motors can be operated by a 10-year-old child.

Tree Planting in America.—The clearing away of the forests in the Middle West of the United States of America has brought home to the great railway companies the need of providing a future supply of ties for their roadbeds. Accordingly, one of the largest of these corporations—the Illinois Central—three years ago planted 200,000 catalpa trees near the town of Du Quoin, in the State of Illinois. This artificial forest is thriving splendidly, and it will not be long before many of the ties on the Illinois Central Railroad will be cut from their own forest, planted in the heart of Illinois. The same company is at work on a similar forest in the State of Mississippi.

Explanation of the Air-Brake.

PROBABLY everybody who travels by rail knows that the train in which he rides is equipped with air-brakes. Probably he knows that the air-brake is an invaluable safe-guard against railroad accidents. But probably, also, he knows so little about the principle and operation of the air-brake that, if asked to explain the appliance, he would undertake to change the subject of conversation. Nor would he be blameworthy on that account.

The fact is that the air-brake, which is distinctly an American invention, is an exceedingly complex appliance. In its latest form it consists of twelve parts, among which are the air pump, which compresses the air; a main reservoir, in which the air is stored; the engineer's brake valve, regulating the flow of air; the train pipe, which connects the brake valve with the triple valves under each car; the quick-action triple valve, controlling the flow of air to and from the auxiliary reservoir, which is supplied from the main reservoir, and the brake cylinder piston rod, which is forced outward, thereby applying the brakes.

The theory of the air-brake is the equalization of pressures. When the brakes are not in action the pressure on the train pipe is made such as to prevent an escape of air from the auxiliary reservoir. When the engineer desires to make an application of brakes he turns his brake valve so that there is a moderate reduction of the pressure in the train pipe. This causes the greater pressure in the auxiliary reservoir to force air into the brake cylinder, forcing the piston out and applying the brakes.

When it is desired to release the brakes the engineer turns his valve in the opposite direction, permitting the air to flow from the main reservoir, located on the engine, into the train pipe. When the pressure, thus restored in the train pipe, is increased above the pressure in the auxiliary reservoir certain valves are moved, communication is thereby restored between train pipe and auxiliary reservoir, the piston is forced to its normal position, the air escapes from the brake cylinder, and the auxiliary reservoir is recharged through the train pipe.

When the train breaks in two or a hose-pipe connection is broken it has the effect of a sudden and material reduction of the pressure in the train pipe, the same as though the engineer had made an emergency application. The sudden reduction of pressure also opens supplementary valves, which increase the pressure upon the brake cylinder about 20 per cent. The brake shoes are attached to rods, which are in turn attached to the piston in such manner that when the air from the auxiliary reservoir forces the latter out a pulling force is exerted upon the brakes.

Progress in Applied Electricity.

EVEN those of us who are almost persuaded that there are no limits to the usefulness of electricity in human utilities are dazed now and then by some new and undreamed-of application of that mysterious force. It is fortunate, therefore, as an educational enterprise, that there has been assembled at the St. Louis Exposition a display of electrical appliances in which the student can witness the farthest advance in the science which is swiftly revolutionizing not merely the motive power but many of the mechanic industries and the sciences and arts of the world.

In the Electrical Building at the St. Louis Exposition one may see carborundum abrading-machines at work—the utilization of a product the first sale of which was at a rate of \$450 a pound. It is now turned out of electrical furnaces by thousands of tons a year, and is cheap. A new transformer for charging automobiles is there, which practically replaced elaborate machinery with a little glass tube, in which a mercury vapor glows brightly as the current passes through it—another electrical simplification. To switch off an electrical current of high speed and power would mean proximity to lightning, for the breaking of contact means a "spark"—an appalling blue flash—that has been known to leap fifteen feet. You see here switches that slip slickly through oil-baths where the spark is smothered. There has been a widening application of electricity to diseases. There are "fool-proof" things—electrical switches, for example, that will do no other than throw a current on by degrees, no matter how rashly an impulsive workman may wish to hurry the connection.

You may see a regulator at work which keeps lights at a uniform brilliancy; it actually floats on a field of magnetism, and wavers up and down as the load on the generator varies with the switching of lights on and off. An electric mine locomotive runs along with no trolley; it trails behind a feed wire running out from a revolving reel, or winding up as the locomotive goes back and forth in the imaginary mine-chamber. A graphic recording ammeter, for testing the quantities of electricity used in different kinds of machinery is already on exhibition—the first one of its kind ever made. It will probably be used in the electric railway tests.

Chemistry in American Industries.

CHEMISTRY as applied to American manufactures involves an enormous outlay of money, but it produces results that pay. Not long ago the Standard Oil Company got hold of a crude oil they could not use because of its vile odor. They sent for a good chemist and told him he must purify it; no negative answer would be taken. The desired result was obtained. When the Cambria Iron Company wants to find out what it can do with two specified pieces of metal it engages a chemist and sets him to work. Experts are paid extremely well for this sort of enterprise. A chemist in the employ of the Standard Oil Company was recently told to produce a vaseline that would kill rats. It was a hard thing to do, but he did it and the result is a new marketable commodity.

Aluminum Smokeless Oil Heaters

EQUIPPED WITH SAFETY BURNER.

SPECIAL **\$35.00** OFFER

FOR FOREIGN
MARKETS:

Upon receipt of \$35.00 in U. S. gold or its equivalent, we will wrap and crate ready for steamer and deliver f. o. b. New York, 4 of each (12 assorted), No. 1, No. 2 and No. 3 Aluminum Heaters. Gross weight, 175 lbs.; net weight, 130 lbs.; cubic feet, 29 1/2.

No. 1—Brass burner; removable fount; 8-in. circular wick; height (ball down), 23 inches.
No. 2—Brass burner; removable fount; 10-in. circular wick; height (ball down), 25 inches.
No. 3—Brass burner; removable fount; 15-in. circular wick; height (ball down), 28 inches.

OUR SAFETY BURNER. Note Construction.

A—Flame spreader perfectly free from perforations.
B—Air space outside of wick tube.
C—Air space inside of wick tube.
D—Wick.
E—Outside casing to burner.
F—Air space between fount and outer casing.
G—Fount or receptacle for oil, entirely separate from burner.
H—Feed pipe connecting oil from fount to burner.
I—Shield resting on top of fount with air space underneath.

Absolutely safe. Explosions impossible. No perforations about the flame spreader to become clogged with oily substances. The only oil heater that radiates heat all over—bottom, sides and top. Only oil heater with partition in drum to deflect the heat and prevent it going straight up, and all because of the grand safety burner. No other oil heater has this safety burner. Order direct or through responsible exporter.

TRADE MARK

IRON CEMENT SHEET PACKING.

BROOKLYN BRIDGE POWER STATION.

New York, March 8, 1904.

SMOOTH-ON MFG. CO., Jersey City, N. J.

Gentlemen:—I have been using your Smooth-On Iron Cement No. 1 for some time back and have found it to be all that was claimed for it. I am now using your Smooth-On Iron Cement Sheet Packing and am pleased to say it is giving excellent results. It is especially good for steam chest covers. Oil has no effect upon it.

Respectfully yours,
WM. SMITH,
Chief Engineer.

EFFORT IN VARIED FIELDS.

Engineering for the Panama Canal.

ACCORDING to J. F. Wallace, chief engineer of the Panama Canal, a small party of American engineers employed in that project have discovered in the last four months what the French engineers did not find out in twenty years. They found a way of diverting the waters of the Chagres River into the Pacific Ocean and removing that at times turbulent stream from the Panama Canal problem. This party of young American engineers, most of them just out of college, was sent to explore the headwaters of the Chagres River. They were abandoned in the tropical jungle by the native helpers and had to carry on their backs the packs that the natives had abandoned. They cut their way foot by foot through the dense tropical growth along the river. They had maps that had been made by the French engineers, but they found rivers where none were indicated on the maps, and found none where they were indicated. About twelve miles from the canal route they found a river on the Pacific slope of the mountains not plotted on the maps, by which the waters of the Chagres can be carried to the Pacific Ocean.

Mr. Wallace estimates that the cost of changing the course of the river will be about \$16,000,000. The estimated cost of controlling the flood waters of the river under the high level plans of the canal is \$36,000,000. By diverting the river to the Pacific Ocean, Mr. Wallace says, the \$20,000,000 saved could be used in constructing a sea-level canal. There are four plans for a canal under consideration—one at the sea level, one at a 30-foot level, one at 60 feet and one at 90 feet. If a high level is decided on, waters of the Chagres will have to be used to supply the water between the locks. The only plan until recently for controlling the flood waters of the river was to dig a channel 600 feet wide and 40 feet deep. The river is subject to sudden rises, and the control of the floods has caused the greatest engineering difficulty in the construction of the work.

Geography and Historical Maps.

AMERICANS justly rejoice in the fact that the assembly of the International Geographical Society in the United States is coincident with the most comprehensive display of historical maps of the western hemisphere ever brought together. In the Government Building at the St. Louis Exposition two separate departments are given wholly to this interesting collection. The maps shown there were specially selected and arranged by the Library of the United States Congress, and are particularly fine specimens, commencing with the mappemonde of Janson of 1618 up to Luffman's map of the United States of 1819, and include the Louisiana maps of Delisle, Senen, Danville, Bellin and Lopez. At the opposite end of the buildings is the collection shown by the Bureau of American Republics, in which are many maps relating to Central and South America.

In the Liberal Arts Building the State of Louisiana displays nearly 200 maps and books containing maps illustrative of the gradual growth of knowledge of the north shore of the Gulf of Mexico, the exact contour of which was not clearly known with the surveys of the coast survey department in 1837 and subsequent years. This collection, loaned to the State by the librarian of the Howard Memorial Library of New Orleans, contains a facsimile of the celebrated map drawn on bull's hide by Juan de la Cosa, the pilot of Columbus on his third voyage; the maps relating to America from the many editions of Ptolemy, and the maps of America and Louisiana by De Bry, Mercator, Munster, Hondius, Hennepin, De Fer, Van der Aa, Delisle, Moll, Homann, D'Auville, Mitchell, Vangundy and Jeffreys. These are arranged, as nearly as possible, in chronological order, and afford a rare opportunity for the study of the gradual settlement of the Mississippi Valley. By this arrangement is shown clearly the duration of the mistake of mapmakers, who, from 1660 to 1713, represented Southern California as an island.

Skilful Work in Tunnel Construction.

AMERICAN engineering skill and the excellence of American implements are exemplified in the construction of the tunnel under the Harlem River in New York City for the underground railway. Here the tunnel was sunk twenty feet below the surface of the river without the use of a shield or of compressed air. And all the time this work was going on vessels passed through the river. The method employed in this work attracted widespread attention among engineers everywhere. First the river bottom was excavated by means of a dredge to about grade level. The river bed was mud and clay. After the excavation had been made twelve-inch tongued and grooved sheet piling was sunk to the bottom and divers were employed to fix cross braces which held the sheeting in place, forming a cofferdam. Then the water was pumped out and parallel iron tubes for the trucks were put in place. The length of the tunnel under the water is four hundred feet. While this work was going on the United States government required that the channel be kept open for navigation, and this was done.

Artificial Camphor.—Artificial camphor in convenient quantities is now produced at a factory near the city of New York, N. Y., U. S. A. The natural product that forms the starting point of the new chemical process is turpentine, by the distillation of which, with oxalic acid, two products are formed, both of which can easily be converted by the action of alkalis into camphor.

Traveling Libraries.

AN educational agency of great value in the United States appears in what are known as traveling libraries—that is, carefully selected collections of standard works of history, fiction, biography, etc., which are taken from town to town for the accommodation of subscribers. This novel institution was first established in the State of Kansas, and the record of its work is highly interesting.

Starting in 1898 with about 3,000 volumes intended for the use of club women of the State, the Kansas Social Science Federation began a system of traveling libraries. In July, 1899, these volumes passed under State control, and they now form a part of the present system, which has reached a total of 15,504 volumes, read by more than one hundred and fifty thousand persons, who are reached in practically every section of the State.

Other States have tried the system with success, and now thirty-three States have traveling libraries. But for the time the system has been in operation in Kansas their growth and influence have been remarkable. It has far exceeded the hopes of those who founded these libraries.

Traveling libraries are furnished on application by some responsible person representing a local library, school district, reading club, literary society or similar organization. The only expense is a fee which is used to pay the expenses of transportation to and from destination. This fee is the average cost to the commission for each traveling library. The libraries are made up of fifty volumes, assorted to meet the requirements of the readers, and packed in strong cases. The applicant may signify the nature of books desired, whether history, travel, biography, poetry, art, science, fiction or juvenile.

He may send a list, which is filled with either the books named or those along the lines suggested. The library may be kept six months or longer if the application be renewed. An extension fee of 25 cents a month is forwarded to the secretary, or the library may be exchanged at any time for another library on payment of the transportation. The applicant, who usually becomes the local librarian, has the general management of the books while they are in his care and their use is left to his discretion.

America's New Army Rifle.

MILITARY experts are of the opinion that the new magazine rifle soon to be issued to the United States Army is superior to any other army rifle in the world. About 40,000 of the new weapons have been completed, but these will not be issued until there are available 100,000, or enough to supply the maximum strength of the army on a peace footing. At the present rate of production the desired number will be ready about December 1st of this year. Some notion as to the efficiency of this new rifle may be gained from the statement that twenty-three aimed shots have been fired in one minute with the rifle used as a single loader, and twenty-five shots in the same time, using magazine fire. Firing from the hip without aim, twenty-seven shots have been fired in one minute, using the rifle as a single loader, and thirty-five shots in one minute from the magazine. With an ordinary charge the powder pressure in the rifle chamber is about 49,000 pounds to the square inch, and the maximum effective fighting range 4,781 yards. The exceptional penetrating powers of the rifle were illustrated in a test held some time ago. With full service charge, the rifle, fired at a distance of fifty feet, drove its steel missile 54.5 inches into white pine butts, and penetrated a steel plate nearly one-half inch thick. The bullet which will be used in the arm has a core of lead and tin composition in a jacket of coupro-nickel and when fired with a service charge has a muzzle velocity of 2,300 feet a second. It is hoped by the ordnance experts that the new gun will prove to be not only abreast of small arms construction, but somewhat in advance, so that it will be unnecessary to make another change in the weapons of the United States Army for a good many years to come.

Fertile Land Still Cheap in America.

AS showing that attractive opportunities for home-builders in America are still open, it is worth noting that Kansas, one of the most fertile and prosperous of the United States, still has 999,436 acres of land which may be bought from the Auditor of the State for \$1.25 an acre. The Auditor's report for the fiscal year shows that 78,490 acres of the public lands were sold and the money paid into the State school fund. The demand for the public land is increasing to such an extent that twenty per cent. more land was sold between June 30, 1903, and June 30, 1904, than in the preceding year. While there is almost a million acres of land yet for sale in the State, the greater part of it is west of the ninety-ninth degree of longitude. The amount of money received by the Auditor during the last fiscal year from the sale of school lands amounted to \$220,054. This will be added to the permanent school fund for the support of the common schools.

New Collars of Celluloid.

CELLULOID collars of a new design for men's wear are among the newest American productions. These collars, which are made of perforated celluloid, are intended for policemen, conductors and others who are compelled to wear uniform collars while on duty. Some of these, prompted both by economy and expediency, adopt celluloid collars. In any temperature these composition throat pieces are hot. In warm weather they are especially uncomfortable. Only the back is ventilated, hence the collar is not unsightly.

THE G. B. ESSEX BRASS CO., Manufacturer, DETROIT, MICH., U. S. A.

RESULTS OF APPLIED SKILL.

New Flying Machine.

PROF. ALEXANDER GRAHAM BELL, of Washington, D. C., U. S. A., has patented a new device for flight which it is believed will go far toward solving the problem of aerial navigation. The device is a tetrahedral or four-sided kite of which much has been written in the last few months. The patent applies more specifically to the tetrahedron or body having four triangular sides, as the unit form for constructing an aerial machine.

Professor Bell drew the papers himself in the application and he says: "The recent developments in kite structure have been largely due to the investigations of Laurence Hargrave. The rectangular cell is structurally weak and easily distorted, requiring internal bracing, which also adds to the dead load, besides opposing additional head resistance to the wind, increasing the drift of the kite. Moreover, there is a limitation to the lifting power of kites of this description, since the mere increase of the dimensions of the kite in its parts does not increase the lifting power proportionately to the supporting surfaces, but just the reverse. This is due to the fact that the weight increases as the cube of the dimensions, whereas the surface exposed to the action of the air increases only as the square. Hence in two kites differing only in dimensions the ratio of weight to surface will be greater for the larger kite than for the smaller.

"I have found that the desired qualities mentioned above reside in a high degree in a cell constructed in the form of a skeleton of a tetrahedron, and cells of this form constitute the units or elements from which a great variety of structures contemplated by this invention are or may be built up. The tetrahedral skeleton or frame may be composed of six bars or rods so connected at their ends as to form the outlines of four triangles. This tetrahedral cell or frame is found to possess, with minimum weight of materials, the qualities of rigidity and strength to a remarkable degree, and for this reason is adaptable to a great variety of structural uses.

"Considering particularly the subject of aerial vehicles, such as kites, the tetrahedral cell possesses rigidity or strength in three directions—that is to say, vertically, laterally and longitudinally—so that internal bracing is entirely superfluous and is dispensed with. When one of the bars is taken as a keel and the two opposite triangular surfaces rising therefrom are covered with silk or other suitable material, the other two triangles being left uncovered, we have a structure which I call a winged tetrahedral cell. Each of the oblique surfaces of this winged cell is the resultant (and equivalent for the purposes in view) of its horizontal and vertical components, constituting a decided gain in lightness as well as in rigidity.

"Obviously in building up a compound structure by connecting together a number of these winged cells the ratio of weight to wing surface remains practically uniform. Experiment shows that kite structures of great size, compounded of these winged tetrahedral cells, fly as well in the same breeze as kites composed of a relatively small number of such elements."

Novel Distance-Recorder.

RURAL free-delivery carriers of mail in the United States are being supplied with a contrivance for measuring their routes, in order that the Post-office Department may be enabled to adjust salaries and other questions on an equitable basis. The machine is a bicycle wheel, larger in diameter than the ordinary wheel, and having attached to it a cyclometer. To the bicycle wheel is attached a pair of iron rods of the nature of shafts, which are made to fit over the axle, the other ends being fastened to the middle of the axle of the vehicle carrying the mails. In this way the bicycle wheel revolves and the cyclometer records the distance made. It is accurate, because it records the actual distance traveled by the vehicle to which it is attached, and not the length of the main roads. If the wagon is obliged to go around a mud hole the cyclometer records the fact, and the distance thus forced upon the horse and the driver by a bad road is placed to the credit of both. There are about 100 of the machines in operation now, and more are to be purchased and distributed whenever the demands of the service call for them. It, therefore, will be a comparatively small matter for the department to at an early date have its rural delivery routes accurately measured and the many thousand miles they cover in figures available at any time.

Advance in Flashlight Photography.

AN American inventor has produced a flashlight powder for photography which has now become so perfected that the notion that such a picture is liable to be faulty because of the startled expression which comes to the eyes of some of the sitters, is entirely erroneous. The powder is quicker than human perception, and long before the sitter has had time to be startled the plate has caught the impression. It is, to be sure, possible so to arrange the powder that its flash continues long enough to show such expression, but no photographer who knows his business does this. The peculiar staring look seen in the faces in some flashlight pictures is generally due to the feeling of expectancy on the part of the sitters while waiting for the flash. If they did not know the flash was coming they would never jump or stare in time for the camera to catch it.

New Type of Canal Boat.

CANAL boats of a new type are about to be installed on the canal between Cincinnati and Dayton, Ohio, U. S. A., their peculiarity being a contrivance which, it is claimed, permits the realization of the advantages of eight feet of water in a depth of a foot or even less. The propeller, being inclosed in the center of the boat in a sheet-iron chamber, gives no opportunity for wash of the banks. On the contrary, the screw stirs up the mud in the bottom of the canal and tends to deepen it and keep it clean. Then the new boats costs one-half as much to propel as the boats by animal power and requires a smaller crew, besides having one-half of the draft of the wooden boat. The new boat is to have a twenty-five horse-power gasoline engine, which will enable it to tow another boat or two if necessary. The device which transforms, as it were, one foot of water into eight is very simple. The basic idea is the creation of a vacuum in a chamber and magazine located in the central part of the boat. The chamber, which is practically nothing more than an elevation in the floor of the boat, is 31 inches wide, 31 inches high, tapering each way 12 feet. The chamber is open underneath and has direct connection with the water in the canal. Within this chamber is located the propeller, the lower flukes of which touch the water. An air-pump exhausts the air from the upright magazine which connects with the chamber. The water from the canal, of course, rushes in to fill the vacuum thus created, rising to the top of the magazine, which is eight feet above the water level. The results are the same as if the boat was submerged in eight feet of water, the resistance and pressure of that depth of water being realized.

America's Best Customers.

FOREIGN appreciation of American products is unmistakably indicated in a statement by Mr. Francis B. Loomis, First Assistant Secretary of State of the United States, as follows: "Great Britain and her dependencies are our best customers. We sell to the United Kingdom more than \$500,000,000 worth of domestic goods every year. Germany comes next with less than two hundred millions, and after that the Netherlands, France, Belgium, Italy, Mexico, Austria-Hungary, Cuba, Japan, Spain, Denmark, China and Russia in the order named. We have a large trade with the British dependencies. Canada is an excellent customer. It takes from us about as much as South America, Asia and Africa combined. In other words, according to the figures of the Department of Commerce and Labor, issued last April, our sales to Canada amounted in round numbers to \$129,000,000, while the total for South America, Asia and Africa is less than \$119,000,000. Australia is another good customer. Its imports are in value about as great as those of Japan, while Great Britain and Ireland buy annually from us more than half of our total sales to Europe, and between two and three times the amount we annually sell to the Germans."

Long Automobile Run.

TO test the endurance of American automobiles in long-distance runs, a gentleman living in the city of San Francisco, Cal., U. S. A., recently made the journey from that point to New York, N. Y., U. S. A., in a single car, covering the route in thirty-three days. The journey was about 4,500 miles, and he traveled an average of more than 135 miles a day. Such a performance shows that the mechanism of good cars has passed the experimental stage. Every year we may expect safer, more trustworthy, simpler and cheaper machines, until one shall cost less than a horse and wagon, and may be run with safety by any man or woman of usual care. Such machines can be made to do all that light wagons now do, and they can be run for less cost for fuel and oil than the feeding of a horse, and with less care than a horse and wagon require.

Copper to Destroy Typhoid.

GREAT interest has been aroused in medical and scientific circles in the United States by the announcement of Professor Moore, of the Department of Agriculture, that copper is an effective germicide for the bacilli of typhoid fever, and extensive experiments to show whether his claim is well founded are proposed in various parts of the country. Professor Moore's own experiments have been undertaken and carried on with strict regard to the importance of the subject, and with that fidelity to scientific demands and acquirements that has always distinguished the experiments conducted by the department. The Washington authorities are considering the adoption of the copper cure for the Potomac water supplied to the city of Washington.

Migratory Labor.

AMERICAN skilled workmen are generally able to change their base when they so desire, but probably none of them move over so large an area of country in the course of a year as do the expert fruit-pickers and packers of the Southern States. They begin their year in Georgia, for instance, where the peach season comes in June. From the south of the State they go to the north; then to Arkansas and Missouri; later to Michigan and to the mountain districts of western Maryland; finally to California and Florida, and thence round to Georgia again. Metaphorically, "cherries are ripe" at every season somewhere in this fortunate land, and he should be a happy man who, even in the way of business, can keep perpetually in touch with the beauty and luxuriance of harvest.

Rider Engine with Deep-Well Attachment.

THE SPRAMOTOR PAINTING AND WHITEWASHING MACHINE.

"DOES THE WORK OF TWENTY MEN."

WINNER OF GOVERNMENT SPRAYING CONTEST. Awarded Gold Medal at Pan-American Exhibition, at Buffalo, N. Y. Highest Award at Toronto, London, Ottawa, Halifax and Glasgow. Over one hundred Highest Awards throughout the world have been granted to the SPRAMOTOR. The Spramotor has been adopted by the Russian, Canadian, Belgian and New Zealand Governments, as well as in the Experimental Stations of Ontario, Manitoba, Quebec, Nova Scotia, British Columbia and many of the States within the United States of America.

NOTE.—The prices quoted, U. S. gold or its equivalent, are for Export only, include boxing, ready for transportation abroad, and delivered f. o. b. cars at New York City.

Spramotor No. 0, Outfit G, with ten feet of hose, hand valve and eight-foot iron extension pipe, patent drip guard and one Spramotor nozzle. Net weight, 22½ pounds; gross weight, 41 pounds; boxed, 12x12x34 inches. Price, complete.....

\$ 8.00

Spramotor Painting and Whitewashing Machine No. 0, Outfit G.

Spramotor Painting and Whitewashing Machine No. 1.

Cottonseed Meal as a Fertilizer.

COTTONSEED meal is used extensively in the manufacture of commercial fertilizers in the United States, and with excellent results. The State of Georgia uses more of such fertilizers than any other State, and their value is easily illustrated. They contain from 1,000 to 1,100 pounds of cottonseed meal to the ton, and about 400 pounds is the quantity used per acre of corn. The quantity varies for potatoes, cotton and other farm produce according to the nature of the crop's requirement.

The following mixture is officially recommended for corn land generally: 1,200 pounds of cottonseed meal, 1,000 pounds of acid phosphate and 30 pounds of muriate of potash. This mixture totals 2,280 pounds and is the bulk proper for a field of five acres of corn, or 456 pounds per acre. Richer lands need less and poorer lands a trifle more. As 1,000 pounds of cottonseed meal contain 68 pounds of nitrogen and the same bulk of cottonseed only 21 pounds, it follows that the meal is more fertile in this respect than the whole seed. Cottonseed meal also contains about 30 pounds of phosphates.

On the basis of \$18 per ton at the farm for a high-grade cottonseed meal fertilizer, and 400 pounds of this to the acre of corn land, the cost per acre would be \$3.60 per acre for fertilizer alone. At the present farm price of corn it would require 9 bushels of corn to pay for the fertilizer used. The experience of the Southern farmer is that the average corn lands without the use of any enricher produce less than half a crop. The average amount of \$18 fertilizer used is 200 pounds, or one sack per acre. Land that ordinarily produces 12 bushels of corn per acre without the use of farm or factory manure will usually produce 30 to 35 bushels by the use of 400 instead of 200 pounds of fertilizer per acre. On the basis of 28 bushels the farmer, for the same labor cost, produces 16 bushels more than a natural soil crop. The extra cost for fertilizer being \$3.60, or 9 bushels of corn at 40 cents per bushel, leaves him 7 bushels profit per acre—that is, net.

The potato crop takes a different mixture. The proper formula for sweet and Irish potatoes is 1,100 pounds of cottonseed meal, 1,000 pounds of acid phosphate and 500 pounds of muriate of potash. This bulk makes 2,600 pounds, and it is required for four acres of ground. The distribution amounts to 650 pounds per acre, or about \$6 per ton. But, then, potato ground produces from 50 to 100 bushels per acre without fertilizer, and from 200 to 600 bushels per acre with a fertilizer.

The extra production of crops by the use of fertilizers and the excellence of the cottonseed-meal mixture for such a purpose have accounted for the large use of this material and the increase in the crushing industry of the South. Farmers have yet to be taught how to properly handle and plow under the compound for the best results, and on these results depend the larger buying of such fertilizers.

Machine for Coaling Steamers.

AN ingenious stevedore in New York, N. Y., U. S. A., has devised a machine for coaling steamers, by which, it is claimed, such operations can be performed more rapidly and more cheaply than with appliances now in use. The contrivance is an adaptation of the endless-belt elevator for the lifting of grain, and it is, therefore, not absolutely new. The practicability of it lies in the ease with which the power may be applied through the use of the electric motor, and the comparative smallness and lightness of the machine. It is 24 feet long—high as it stands on end while in operation—and approximately 3 by 3½ feet in its other dimensions. Its weight is only two tons. Run at full speed, this elevator can put 100 tons of coal into a steamer from a barge in one hour, with a crew of five, including an attendant at the starting box of the motor, two shovelers on the barge and two trimmers in the hold of the steamer. With four elevators in operation—two on each side—the most voracious of the coal-consuming steamers can be supplied with sufficient fuel in ten hours. The process is not only quicker than the old way, but it is more economical, as no coal is lost overboard in the handling.

Boat That Digs Its Own Canal.

NEAR the Pacific Coast of the United States, but remote from sea, lake or river, may be seen a pit nearly a mile long, 40 feet wide and 15 feet deep, in which floats one of the queerest vessels in existence. It is a large, flat-bottomed barge, seamed and caulked and made properly seaworthy. On the barge are erected derricks, and much strange machinery driven by powerful electric motors. By the time all is installed water has percolated into the pit, and the boat, built under such queer conditions, is afloat. This is the gold dredge. The sand with which it is surrounded contains gold in quantities which would not pay to work out, except by such a scientific apparatus as this. When operations begin the sand and soil in front of the boat are dredged up, dumped into sluiceways on board, washed, sifted and treated so as to secure valuable particles, and the débris (tailings) is then deposited over the stern. The work goes on continually, the unwieldy boat gradually eating its way through the marshy slopes, filling in the canal behind, as it works along foot by foot, and never having floating room more than a few feet beyond its own length. The electric current is generated in a separate power house on land, a short distance away, and conveyed to the motors on board by the usual conducting wires.

Courtesy in Business.

COURTESY costs nothing, but it is not lacking in value. In business it can be employed to increase sales, prevent the loss of profitable lines, secure valuable information, and not infrequently to collect or secure doubtful accounts. The sour, crabbed, gruff-spoken business man must in the very nature of things repulse trade and profitable suggestion, and gain the ill-will of a considerable portion of the people with whom he comes in contact. Men who, unless under obligations, endure patiently and without resentment the discourteous treatment of others constitute a small minority. Human nature rebels against discourtesy and abuse. It does not always manifest its resentment by retaliation in kind. If it did, the menace to an impolite tradesman's business interests would be slight. The danger lies in the nursed wrath, the anger that bids its time.

The sales manager of an implement manufacturing concern waiting at a junction point for a homeward bound train called upon a dealer who handled one of the company's popular lines with great profit. It was the first meeting of the two men. The dealer, noted for his discourtesy to strangers, especially to strange salesmen—a reputation he was proud of—mistaking the manager for one of the fraternity, ignored the proffered card, made some contemptuous reference to the number of salesmen who "bothered" him, and interrupting the attempted explanation turned on his heel and bolted for the rear of the store. The next season one of his competitors handled the popular line with great success. Five hundred dollars would not cover the discourteous dealer's loss in that one season.

A manufacturing corporation was in financial straits and seeking a settlement whereby creditors were to have the option of 75 cents on the dollar cash or 100 cents in stock in the company. It was believed by those familiar with the conditions that the embarrassment was assumed, it being the purpose of the majority stockholders to force an assignment and then buy the plant at half its value. A distant iron merchant creditor, hesitating between the two propositions, sought advice from one to whom he was referred, one who was informed of the company's true condition and knew of the principal owner's purpose. It happened that this one had received discourteous treatment from the identical iron merchant a few months before. On his advice the iron merchant accepted stock in the company to the amount of his claim. Three months later the company assigned, and subsequently the principal stockholder bought the business at 35 cents on the dollar. The discourteous iron merchant received as much for his stock. As his claim was large it will be seen that this one act of discourtesy cost him dearly.

These incidents of widely different circumstances serve to illustrate how important it is to be courteous on all occasions. One never knows when the consequences of an ill-mannered act will bring loss in some form to his business. It is especially important for retail dealers to cultivate the friendship and regard of salesmen. With rare exceptions the most successful retail tradesmen are those who have the most friends in the traveling fraternity.—*Farm Implement News.*

New Trench-Digging Machine.

BUILDERS in New Orleans, La., U. S. A., are constructing a machine for dredging trenches, which seems likely to be a labor-saver of great value.

The machine is so extremely simple that experts are wondering that it was never thought of before. The fact is there is no new principle involved, the idea that is patented being the combination of two well-known principles, both of which have been applied for generations. In the rear of the machine is an ordinary scoop-dredge, such as every one is familiar with, consisting of a long arm, with a spade attachment at the end, which is worked by a system of levers and pulleys that lowers and drags it through the ground just as you would imagine a giant doing with a monster spade.

Formerly this arm had to be stopped in its operation of digging and swung out to dump the dirt it had taken up. In the new machine this time is saved by a system of revolving buckets that come down under the arm empty, fill with the dirt taken up in the spade at the lower end, go up on the upper side of the arm filled with dirt, which it dumps into a trough at the top, with two extending arms, supplied with revolving belts, that pour the dirt in two streams on either side of the trench that is being dug. The best calculations show that in the old machine one-third of their working time is consumed in the swinging out of the arm and discharging the dirt, and absolutely all this time is saved by the new machine.

Making Schools Attractive.

IN order to obtain the largest possible attendance of children at the public schools in the United States it is proposed in some States that the local authorities shall provide free midday meals for pupils. Another proposal is that as a means of doing away with truancy the State should pay every child between the ages of 6 and 14 years a certain sum for every day he or she attends school. When one hears of propositions like these he naturally wonders where the limits of expenditure for public education will be set. The cost of the public schools is now high; there is no knowing how it would swell if some of the proposals made should be adopted.

Olds Gas and Gasoline Engines

Are built on lines of strict originality, and are protected by the Olds patents. The essential parts of our engines combine the highest efficiency with the greatest simplicity of construction and operation. No engine made approaches the Olds for economy and durability.

Stationary Engines, - 2 to 100 H.-P.
Portable Engines, - 8 to 18 H.-P.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest Medals:

Gold, Silver and Bronze.

Excels on Every Point.

Cheapest to Use in the End.

TESTIMONIAL. NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly, (Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

THE WORLD'S STANDARD FOR FORTY-ONE YEARS

RACING COMPOUND for Wooden Yachts' Bottoms,
Bright and Smooth.

Manufactured Only by TARR & WONSON, Limited,
GLOUCESTER, MASS., U. S. A.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as by the ordinary method and is the only utensil that will produce **Lattice Potatoes**. Is extremely simple to operate and sells rapidly wherever shown.

\$16.50 Upon receipt of **SIXTEEN and 50-100 DOLLARS** in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] **No. 6 X SLICERS, for Export only.** Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our **NO. 6 X SLICERS** and other specialties manufactured by us.

HEADWAY IN LABOR SAVING.

Steam Power in Harvesting.

AMERICAN agriculture is conducted on so broad a scale that the use of steam-propelled machinery is entering more largely into its operations every year. The steam harvester is practically indispensable on the great farms in the Western States. Such an outfit usually consists of a traction engine, separator, cleaner and header, and with it the grain is cut or headed, threshed, cleaned and sacked in the field ready for shipment. A representative style traction engine for such service is of 50 horse-power and constructed without gears. The cylinder is 9½ by 9 inches; drive wheels, 24 inches wide by 7 feet high; height of engine, 12 feet 4 inches; height of engine to top of smokestack, 18 feet 4 inches. The general mechanism is embodied in a friction running on the main crank shaft. This may be readily thrown out of gear. But two sets of chain are used, and these with the friction constitute the entire mechanism. The engine may be turned in a space as limited as its own length.

The separator is 40 feet 8 inches long and 11 feet wide; including the sack dump it is 18 feet 7 inches wide. The cleaner is 5 feet wide, and the cut 42 feet wide. The height of the combined harvester is 12 feet 6 inches, and its extreme length, including engine and separator, is 65 feet 2 inches. To operate such an outfit a crew of eight men is required, made up of one engineer, one fireman, one man to haul water and coal, one for the separator, one header-tender, two sack-sewers and one sack-filler. When the grain stands well and water and fuel are convenient, the outfit will cut 120 acres per day, and as high as the product of 150 acres, or 4,200 bushels, has been cut, threshed, re-cleaned and sacked in a single day of twelve working hours.

The approved style of steam-generator for these steam-harvesting outfits is a return tube water-leg firebox type of horizontal boiler, in which the flame and heat are carried through over two mud drums and returned through the small tubes in the main portion of the boiler, thus utilizing the heat in the fullest degree and producing the maximum amount of steam while reducing the risk of fire from sparks. In the smaller outfits already mentioned there is used in some instances a Scotch marine type corrugated flue boiler especially designed for burning crude oil.

The water-carrying capacity of the tanks on the engine is from 400 to 750 gallons. The water consumption is from 2,500 to 3,000 gallons per day. The amount of fuel consumed in the operation of such an outfit varies, of course, under different conditions, but the average daily consumption may be set down as 1½ cords of good hard wood, one ton of first-class steam coal, or 200 gallons of crude oil.

One of the most vital questions confronting the farming interests to-day is the scarcity of labor, and this tendency alone is cause for power-operated implements. Within a few years, through the agency of steam and gasoline, the staple agricultural products of the United States will stand without a rival from the point of view of low cost of production.

Uses of Liquid Fuel.

AFTER exhaustive tests extending over a period of more than a year with scores of appliances, new and old, the official board appointed by the United States Government to determine the relative values of coal and liquid fuel for marine and naval purposes has made a report which is of general interest. The report fills a volume of upward of 500 pages, but the gist of it, so far as concerns the use of petroleum in steam-making, is contained in this one conclusion: "That in the consideration of the problem of attempting to use oil as a fuel for either marine or naval purposes it should be particularly remembered that, by reason of the economic and commercial demands for crude oil for illuminating, lubricating and other purposes, the available supply of the world's production of crude petroleum that could be used as a fuel would not meet over 3 per cent. of the world's demand for coal and other combustibles. For a time, therefore, the effort should be made to use oil fuel only for special purposes in particular localities. The board regards the engineering or mechanical feature of the liquid-fuel problem as having been practically and satisfactorily solved. For manufacturing purposes the financial and supply features are the only hindrances to the use of crude petroleum as a standard fuel. For mercantile purposes the commercial and transportation features of the problem are existing bars which limit the use of oil fuel in merchant ships."

Automobile for Gold Seekers.

PROF. GILBERT E. BAILEY, of San Francisco, Cal., U. S. A., has built an automobile which he will use in prospecting for gold in the famous Death Valley in southern California—a region which has been the graveyard of hundreds of explorers who have fallen victims to the awful heat and desolation. It is absolutely devoid of water and vegetation, and its reaches of blistering sand are strewn with the bleaching bones of its victims—men, horses and cattle. Every one knows this region is rich in minerals, but parties that have ventured into it even in winter are forced to carry a large outfit to guard against death by thirst. For three prospectors eight horses are necessary, six being devoted to hauling foodstuff. This makes travel slow. Professor Bailey's automobile is a strong runabout, to which he has made a number of attachments for carrying implements and supplies. He will test its capacity by some preliminary trials, after which he will enter the desert.

Cooking by Electricity.

THE use of electricity for domestic purposes in the United States has extended to the kitchen, where it has greatly simplified the labor of cooking. Of electric cooking apparatus there are innumerable devices such as portable stoves, saucepans, tea-kettles, brazers, boilers, broilers, coffee-pots, electric ovens, griddle cake cookers, waffle irons, water urns, etc. Then there are numerous other household electric devices that are extremely handy, but which may not be properly classed as kitchen utensils, such as ship-food warmers, immersion coil heaters which may be inserted in any kind of a vessel and used for heating liquids.

Other domestic uses of electricity are interesting. Electric heating pads for the application of heat to the human body is as great an improvement over the hot water bottle as the latter was over the hot brick which our forefathers used. In the electro-therm, as this new device is known, the heating units are covered with soft lambs' wool and as high a temperature as 180° Fahrenheit may be easily maintained or a lower degree of heat may be had to suit the exigencies of the case.

Electric curling irons for the lady traveler is a dainty toilet accessory that has found great favor with the fair sex and more than fifty thousand of these appliances are now in use. They may be attached to any lamp socket, for they use the same amount of energy as an incandescent lamp; when the curling irons are removed the current is automatically cut off.

Cigar lighters, which use the current only while the cigar is being lit, is another unique adaptation of the electric unit to the needs of the public. It is operated by merely pressing a button, when the current strikes a little arc between two carbons.

Soldering-irons operated by electricity show the popularity of labor-saving tools. These irons are extensively used in telephone work. Pitch-kettles, sealing-wax pots, flask-heaters, instrument-sterilizers and flatirons nearly complete the list of stock-in-trade appliances. All kinds of heavy machinery, however, requiring heat in the processes of manufacture, as laundry machines, paper calenders, etc., are making use of these up-to-date devices.

Among the many and varied applications of electric heating to the arts, sciences and industries, none are more curious than that of hatching chickens. One of the greatest difficulties of artificial incubation is to keep the temperature constant. It is impossible with oil lamps, but with electricity the matter becomes exceedingly easy:

Thousands of electric heating units have been supplied to the various industries throughout the world, and these embrace electrically operated irons in hat manufactories, drying molds for the making of artificial teeth, branding irons for cigars and cigar-boxes and other places too numerous to mention.

New Thing in Burglar-Proof Safes.

TO the genius of an inventor living in Joplin, Mo., U. S. A., the world is indebted for a burglar-proof safe which seems to be really burglar-proof. The outside door of this safe opens a cross-bar cage and is opened by means of a time lock. When the time designated arrives the door swings open and a powerful electric current is shut off. This current is calculated to kill any one who is so foolhardy as to touch the outside of the safe with a conductor of electricity, such as a burglar tool. Every portion of the surface is heavily charged by a battery, which is enclosed in the inner depths of the safe. In order to reach the interior, the battery and the valuables, it is necessary to work a combination on the second door, which is also on a cross-bar cage. The bars of the second cage run contrary to those on the outer cage and they are also steel. The money-drawers are opened with keys. The inside of the safe is lined with a substance composed of asbestos, cement and plaster of paris which the inventor claims is absolutely fireproof.

Using Heat from Friction.

EXPERIMENTS are now in progress in St. Louis, Mo., U. S. A., with a novel system of heating for large buildings. The heat is produced by friction. The invention consists of a steel tube surrounded by a jacket, and inside of the tube a wooden roller, cut into four triangular sections and arranged about a steel shaft. A water chamber outside of the tube is 10 inches in diameter. A two-horse-power motor is used to operate the machine, and tests have shown that at a speed of 700 revolutions it will heat 990 gallons of water to a temperature of 160 degrees in fifty-five minutes. At 700 revolutions steam is produced in five minutes from the time the machine is started, and during the next forty-five minutes steam is made at the rate of a pound a minute. From that time on there is a gain of ten pounds of steam every three minutes. It has been shown that the machine will produce the wonderful gain of 200 pounds of steam an hour.

American Petroleum Product.

CALIFORNIA is now foremost among the United States of America in the production of petroleum, her output for last year having been 24,382,472 barrels. Ohio came next with 20,480,286 barrels; other States following thus: Texas, 17,955,572; West Virginia, 12,899,395; Pennsylvania, 11,355,156; Indiana, 9,186,411; New York, 1,162,978; Kansas, 932,124; Louisiana, 917,771. Small quantities were produced in Kentucky, Tennessee, Colorado, Wyoming and three or four other States.

No. 708. Two and one-half inch openwork gilt frame, showing pearl oil painting on glass. Size of glass, 10x20. \$10.20 net, per doz. Variety of subjects.

Thousands of Protectographs

Are now in daily use by the leading financial, industrial and mercantile institutions of America, and are exclusively employed by the United States Government.

The machine is a marvel of simplicity, being but six inches square and weighing only ten pounds, boxed ready for shipment. One movement of the lever indents the limiting line upon any preferred part of the check (see reduced facsimile of check) and by its system of compound levers forces an especially prepared indelible ink into the fiber of the paper, making it a part of the document itself and rendering its removal impossible.

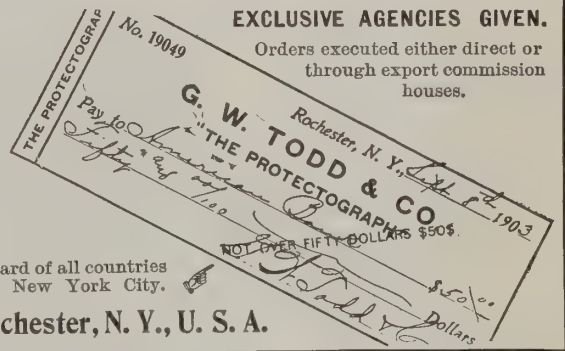

The Protectograph is made to conform to the monetary standard of all countries and to print in any language. The price is \$30, delivered New York City.

PRINTS BRIGHT GOLD.

"IDEAL" Steam Cookers

FREE Book of 36 pages, printed in colors; handsomely illustrated; tells all there is to know about steam cookers—round or square. The 1904 models of "Ideal" Steam Cookers are entirely new in principle, design and special features. The only steam cookers made in which both round and square have whistles to call the cook when water is needed. Seamless copper tank bottoms.

Cooks a whole meal over one burner, on gasoline, oil, gas or common cook stove. Reduces fuel bills one-half. Agents wanted.

We Want Foreign Agents, and to get them quickly, we are making the following liberal proposition for this month:

No. 20 Sq. Copper Tank

Retails \$6.50 Each.

13-gallon food capacity. 12 Cookers in a box. Measurements and weights of boxes holding 12:

Gross weight, 210 lbs.

Net weight, 144 lbs.

Cubic feet in 12—28.

\$39 doz., f. o. b. N. Y.

No. 6 Round Cooker

Retails \$5.00

10-gallon capacity. 12 Cookers in a box, nested, solid. Measurements and weights, 12 in a box:

Gross weight, 150 lbs.

Net weight, 120 lbs.

Cubic feet in 12—11 1/2.

\$33 doz., f. o. b. N. Y.

These are our best sellers, but we make thirty different sizes of Cookers. Boxed ready for steamer. Order direct or through export house; in latter case, mail duplicate order to us to avoid errors.

We manufacture a full line of Kitchen Specialties and Blue-Flame Wickless Oil Stoves.

"Brown's Bronchial Troches"

A WORLD-RENOUNDED REMEDY

For Coughs, Colds, Bronchitis, Asthma, Catarrh, the Hacking Cough in Consumption, and numerous affections of the Throat, giving immediate Relief. They have received the sanction of physicians generally and testimonials from eminent men throughout the world. All dealers in medicines and proprietary goods can recommend them with confidence. Caution.—"Brown's Bronchial Troches" are sold only in boxes or bottles, with facsimile of the proprietors on outside wrapper of the package.

JOHN I. BROWN & SON, Proprietors, Boston, Mass., U. S. A., and London, England.

PURE, WHOLESOME WATER!

There is good, pure water in the ground if you know how to get it. The ordinary dug well is apt to be contaminated from surface drainage.

THE PORTABLE STAR DRILLING MACHINES

will tap the stream in the best possible manner, and will insure an abundant supply of good, pure water.

An energetic man may become rich doing well digging for his neighbors. With one or more of our machines he can build up a permanent and successful business.

The Star Drilling Machines are made in Ten Sizes. Will Drill 250 to 2500 Feet.

We make the strongest, the safest, the most complete and simplest machine. **Everything needed goes with it.**

ABSOLUTELY WITHOUT SPRINGS.

We also manufacture Drilling and Fishing Tools.

F. R. PATCH MFG. CO.,

RUTLAND, VERMONT, U. S. A.

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing,
Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering apparatus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, so that prompt delivery can be made.

The Invincible Coffee and Spice Milling and

Separating
Machine

This machine will mill coffee and spices perfectly without breakage or waste. It is complete in itself. It will thoroughly separate the coffee from foreign substances, and then clean and polish the same so that it is ready for the roaster. Its perfect ventilation increases its efficiency. In cleaning and polishing coffee it does not break the berry as is frequently the case with other milling machines. We shall be pleased to send to all who are interested full particulars. Please order direct or through any export agency.

A Perfect Substitute for Pitch.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.

The Tucker Alarm Cash Till.

A perfect day safe. The act of closing locks the till. Over one million now in constant use. No key to be lost. Susceptible of 32 changes. Opens like a common drawer. A terror to sneak thieves. Handsomely finished in walnut, oak or cherry woods. Varnished and polished.

As a piece of cabinet work, well worth its cost.

Sounds the alarm promptly if tampered with. Delivered ($\frac{1}{2}$ doz. in a case) free to vessel. Catalogues in English and Spanish.

"FOR THOSE WHO WANT THE BEST."

Fiberlite Shade and Holder.

Shade made from fiber similar to that used for lining sockets. Mottled green on outside and pearl gray inside. Fiber finished under pressure which gives it a gloss finish, furnishing fine reflection for light. So tough that edges will not break and so springy that it cannot crush. Holder of heavy wire; one piece, clamps to socket with a catch. One catch and no screws. Fastens to inside of shade and any tendency to pull off only makes it hold more securely.

Light as aluminum shades, which means cheap freight rates.

TO INTRODUCE ABROAD:

Upon receipt of \$10.00 in U. S. gold or its equivalent, we will box and deliver f. o. b. cars at New York, five gross of these shades in assorted sizes.

Don't Buy Without Reading Our
Incubator Book.

First of all, get this book. No matter what other makers you write for a catalogue, write us, too. We will send you the best book of all—written by the man who has devoted 22 years in perfecting RACINE HOT-WATER INCUBATORS AND BROODERS. When you learn what he knows you will want his machine, we think. The book is our illustrated catalogue—that is why we send it free. But it is more than a catalogue. It tells all that an incubator should be and why. Write to-day for it. Reliable representatives wanted. Prices quoted for export admit of big profits. Address

Racine Hatcher Co., Box 217, Racine, Wis., U. S. A.**Incubators**

THE BEST THAT SCIENCE
AND MONEY CAN PRODUCE.

The **"SUCCESSFUL"**

is regarded by those who have made money out of poultry raising as the greatest egg-hatching machine of the day. Heat, moisture and ventilation controlled automatically. Hatches well in the hottest and driest climates of the world. The walls of our machines are built on the refrigerator plan and packed with mineral wool asbestos. Sizes from 54 to 400 eggs. Prices from \$10 to \$37. Both hot-air and hot-water heating systems used. All hot water tanks made of 14-oz. planished copper.

A reliable representative wanted in every foreign country who is prepared to purchase a supply of Incubators and brooders. Catalogues printed in English, French, German, Swedish and Spanish. Send for either Catalogue. Address

DES MOINES INCUBATOR CO., Dept. 611, Des Moines, Iowa,
or Dept. 611, Buffalo, N. Y., U. S. A.

**Gem Incubators**

Are low in price, but this does not mean that they are cheaply made, or that they are inferior in any way. In fact, they are high grade in every particular and have several important features not to be found in any other hatcher.

Prices reasonable. Results guaranteed. Send for beautiful illustrated catalogue, mentioning this paper. Reliable agents wanted. Address

GEM INCUBATOR CO.,
Box A1, Dayton, Ohio, U. S. A.

A HATCHING WONDER

The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17 1/2 inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

**CYCLE HATCHER CO., Salem, N. Y., U. S. A.****200-Egg Incubator for \$12.80**

The simplicity of the Stahl Incubators created a demand that forced the production to such great proportions it is now possible to offer a first-class 200-egg incubator for \$12.80. This new incubator is an enlargement of the famous

WOODEN HEN

recognized the most perfect small hatcher. This new incubator is thoroughly well made; is a marvel of simplicity, and so perfect in its working that it hatches every fertile egg. Write for anything you want to know about incubators. Send for the new free illustrated catalogue.

Cable address: "OEZRIC," New York.

313 West Street, New York, U. S. A.**OUT-HATCHES ITS COMPETITORS!**

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

Ladies in the United States buy the wool soles, crochet and sew the upper onto the sole, thereby making their own slippers for house wear. Invaluable for invalids. Orders filled through commission houses. Correspondence solicited.

WORCESTER, MASS., U. S. A.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

PELTON WATER WHEELS

PIKES PEAK POWER CO.

The illustration herein shown is that of Pikes Peak Power Co.'s Hydro-Electric Transmission Plant, located near Victor, Colorado. It consists of three 1,000-horsepower Pelton Wheels, operating under 1,180-foot head and direct-connected to electric generator.

This electric power is supplied to the many mines, mills and other industries in that vicinity. This plant has been running day and night for four years at practically no expense for repairs. Send for catalog illustrating many other plants of similar character.

PELTON WATER WHEEL CO.

150 Liberty Street, New York.

128 Main Street, San Francisco.

75% OF YOUR PAINT BILLS SAVED BY THE USE OF OUR PAINTING MACHINES AND READY=MIXED COLD=WATER PAINTS

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.

THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the LOUISIANA PURCHASE EXPOSITION amount to something over 12,000,000 SQUARE FEET, all of which is practically completed at this writing, and at least 95 PER CENT. OF THIS WORK WAS DONE WITH THE MACHINES WE BOUGHT FROM YOU. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

WE TAKE PLEASURE IN STATING THAT, IN OUR ESTIMATION, YOUR MACHINE IS FAR SUPERIOR TO ANYTHING ON THE MARKET.

THE COLD-WATER PAINT USED AMOUNTED TO ALMOST 400,000 POUNDS.

Respectfully yours,
BUILDERS' CONTRACTING COMPANY.

No. 3 "Rapid" Painting Machine.

Our Ready=Mixed Paints

are made from pure minerals, ground with a liquid chemical into a thick paste, which only requires the addition of water to be ready for instant use.

Our Ready-Mixed Paints are

**WASHABLE,
WEATHER-PROOF,
FIRE-PROOF,
SANITARY**

and Cost but One-Tenth (1-10) as Much as Oil Paint.

Made in WHITE and a variety of colors.

Packed in strong, iron-hooped barrels, half-barrels and kegs.

Our booklet, entitled "Your Painting Bills Made Smaller," contains valuable information concerning Paint and Painting Machines, a copy of which will be mailed postpaid to any part of the world.

Rice and Coffee Hulling Machinery

Improved Rice Huller and Polisher.

OUR RICE HULLER

Is the only machine that will take rough rice and in one operation make it merchantable. For simplicity, durability and economy has no equal. They are used on plantations, and also in the largest mills. Both the Coffee and Rice Hullers are made of iron and steel, and can be knocked down and packed for mule transportation if desired.

OUR COFFEE HULLER

Will hull pulped or cherry coffee without breaking or leaving unhulled a single grain. The products will come out clean, polished and free from hulls, ready for bagging, all in one operation. It is the Only machine that will grind the hulls fine, so that they may be sucked by the blower through the screen underneath the machine, leaving every grain of coffee inside of the machine, no matter how small it may be.

Latest Engelberg Coffee Huller.

KELSEY & CO., Meriden, Conn., U.S.A.

Griffin Cleaner and Paste Combination

for Cleaning and Polishing Russet and Russia Leather Shoes and all Articles made of Russet and Russia Leather.

NOTE—Our Cleaner contains no Camphor.

Our Cleaner and Paste Combination for cleaning and polishing Russet and Russia Leather Shoes (and all articles made of Russet and Russia Leather) cannot be surpassed, if used according to directions.

The Cleaner cleans and removes stains, and the paste produces a brilliant, durable waterproof polish, which is not sticky or gummy. We also make it in different colors, ox blood and brown.

Price per gross, large size.....\$14.00

Price per gross, small size..... 7.50

Discount, 10 per cent.

Griffin Russet Leather Polishing Paste.

Our Russet Leather Paste for producing a high gloss on Russet and Brown Leather Shoes (and all articles made of Russet or Brown Leather) cannot be surpassed, if used according to directions. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and yet is not a varnish.

Excellent for vici kid.

We guarantee it not to injure the leather in the slightest degree, as it is free from acids, and will not soil the finest of fabrics.

If the shoe is dirty it should first be cleaned with Griffin Russet Leather Cleaner.

Price per gross, large size.....\$6.00

Price per gross, small size..... 3.50

Discount, 10 per cent.

Our Parisian Dressing.

A Black Dressing for Ladies' Shoes. Is considered by good judges to be the best and nicest put-up 10-cent dressing on the market.

We guarantee it not to contain anything injurious to the leather. It contains oil which helps to keep the leather soft and pliable. Packed in one and three dozen boxes.

Price, per gross, \$8.00.
Discount, 10 per cent.

Griffin Sterling Combination

Our Sterling Combination for dressing and producing a gloss on shoes made of Box-Calf, Cordovan, Vici Kid, French Enamel and all fine dry black leathers. Cannot be surpassed if used according to directions. It is easily applied, polishes quickly and easily; its lustre is brilliant, durable and will not crack or scale off. It keeps the finest of leather soft. We guarantee it not to injure the leather in the slightest degree, as it contains no acid or other injurious substances.

A circular in each package giving full directions.

Price per gross, large size.....\$15.00

Price per gross, small size..... 8.00

Discount, 10 per cent.

WORTH WAITING FOR

Griffin Patent Leather Polishing Paste.

Our Patent Leather Paste for restoring the gloss to all articles made of Patent and Enamel Kid Leather cannot be surpassed. It polishes quickly and easily; its lustre is brilliant, durable and waterproof, and is not a varnish, as it leaves no coating.

We guarantee it not to injure the leather, as it is free from acids.

It is invaluable for brightening the saddle and blinders of harness, as the polish is waterproof.

Just the thing for manufacturers of harness to use, as it will prevent the Patent Leather parts from becoming dull.

Price per gross, large size.....\$6.00

Price per gross, small size..... 3.50

Discount, 10 per cent.

Griffin Russet Traveler's Outfit.

An excellent thing to take along when traveling.

Contains a bottle of cleaner for cleaning and removing stains. A box of our polishing paste and a polishing mitten.

GUARANTEE WASHER.

GUARANTEE WASHER.

OCEAN WAVE WASHERS

Wash the clothes as easily and cleanly as sea waves wash the beach.

OVER 100,000 NOW IN USE.

Shipping weight, 85 lbs.

Size, 2 x 2 x 3—12 cubic feet.

SPECIAL FEATURES.

Our Gearing: Simple in construction; impossible to throw out of gear; the longer it is used the easier it will run. Our Fly Wheel has no threads to strip; no nuts to lose, being attached or detached in a moment's time. Our Improved Dasher is hand-turned; clothes do not cling to it and tear. We assure free action of dasher by using heavy galvanized flanged ring in dasher block, thereby relieving all friction. In general construction of tub and finish, only best materials are used. We ship through any responsible New York exporter. All orders must be sent to us direct.

VOSS BROS. MFG. CO.,
DAVENPORT, IOWA, U. S. A.

ONCE SOLD, THEY NEVER COME BACK.

THERE IS NO FRICTION.
NO LOST MOTION.

THE GENUINE

"O-K" WASHER.

KNOWN AND IN USE THROUGHOUT THE CIVILIZED WORLD.

The O. K. is the KING of ROTARY WASHING MACHINES! Because:

1. The O. K. is the only Rotary Washer that has Revolving Steel Ball Gearing, reducing the friction and thus making the machine so light running and almost noiseless.
2. The tub is made of Louisiana Red Cypress lumber, and corrugated similar to a washboard. The legs are made removable, and are packed inside of the tub, as are all of the castings.
3. The wheel turns right or left, pin-wheel or dasher reverses automatically, turning the clothes back and forth through the hot soap-suds, and cleaning them without rubbing them to pieces.
4. The O. K. Washer is made by experienced mechanics, and will outlast any other washer on the market.
5. The tub has a wringer box, fastened with steel brackets.
6. The lid on tub closes tight, no escape of steam.
7. Has glided hoops, castings and name.

Prices quoted F. O. B. New York. Each O. K. Washing Machine, crated, ready for transportation abroad, weighs about ninety (90) pounds, and occupies nine (9) cubic feet.

Manufactured Exclusively by

H. F. BRAMMER MFG. CO.,

LESSONS OF THE WORLD'S FAIR.

WHILE the St. Louis Exposition has still a month to run, it has already taught certain lessons which are fit subjects for consideration. The artistic success of the undertaking was assured almost from the outset. In the varied beauty of its grounds and buildings, in the magnitude and splendor of its assembled displays, representing the foremost achievements of science, art and industry among the races of men, and in the thoroughness of its arrangements for the safety and comfort of visitors, the St. Louis Fair has had no superior and probably no equal among international exhibitions. It is specially gratifying, therefore, to learn that it is likely to be entirely successful financially, as well as in the artistic sense, and that the large-minded men who devised and executed this colossal project will, as they declare, be able to close their books with a substantial balance to the credit side.

The St. Louis Exposition has been more distinctly a business men's exposition than any of its predecessors. It was organized on business principles and in the main has been conducted in accordance with sound business system. Moreover, this exposition has not only assembled in one of the great commercial centers of America a surpassing display of the products which predominate in the trade exchanges of the world, but has drawn to our shores a vast number of representative business men from other nations who, by personal observation, have, we hope and believe, acquired a better understanding of American resources, American processes and American business methods. The presence in the United States of this large number of gentlemen representing the agencies so indispensable to our vast interchange of commodities with other nations has been one of the most gratifying incidents of the exposition year. No guests have been more cordially welcomed. To none has American hospitality been extended with heartier good will. They are our brethren and competitors in the honorable rivalries of trade. We have learned from them and they from us, and we profoundly believe that their influence, broadened and strengthened by their observations in the United States, will be a powerful and lasting force for the steady increase of commercial intercourse between their respective countries and our own.

We conclude, therefore, that one of the foremost lessons of the St. Louis Exposition is that it is first of all a triumph of business enterprise and achievement, and that its most valuable influence will be exerted along the lines of commercial progress throughout the world. The spirit of the business age is predominant. It is an expression of our own times, our own ideals, methods, processes and performances, and its crowning glory will lie in the fact that it has presented to the world more comprehensively than any of its predecessors the triumphs of ingenuity, skill, energy and enterprise in

those fields of endeavor which contribute most largely to the daily comfort, ease and progress of mankind.

In recognition of the fact that the St. Louis Exposition has profited so enormously from the predominance of the business interest and influence, it is already seriously proposed that when another great international fair is held in the United States it shall be instituted and controlled absolutely by the National Government. For the United States this idea is entirely new, but it is worth earnest consideration, and the mere fact that it has been approved in high circles is both significant and flattering to the business world.

THE AMERICAN ELECTIONS.

BEFORE the next number of THE AMERICAN EXPORTER makes its appearance, the American people will have elected a President and determined the party complexion of the National Government for the ensuing four years. The campaign leading up to this election has been singularly listless and devoid of excitement, but uniformly dignified, good-natured and worthy of a patriotic nation. It would be a great error, however, to attribute the serenity with which the great mass of intelligent voters have observed the progress of this remarkable campaign to anything like real indifference on their part. It is due, rather, to a widespread conviction that the final result, no matter what it may be, will have no harmful effect whatever upon the legitimate business interests of the country. The two leading candidates are both of them high-minded, patriotic gentlemen of almost ideal character, commanding abilities and large experience in the public service. To be defeated by a man of that type will carry no sting to his fallen rival. It will not cause even a ripple upon the surface of the orderly administration of law and justice, nor cast a shadow of reproach upon the independent judgment and good faith of the American electorate.

The truth is that the American business man, in full confidence that the final outcome, whatever it is, will have no damaging effect upon his investment and enterprise, has been too busy to take any active part in this year's campaign. And, what is more significant, he is getting busier every day. All signs point to a pronounced revival of activity in American manufacturing enterprise of nearly every description. In many branches, indeed, notably in the iron and steel industries, the upward movement has already begun. The demand is increasing, the number of plants in operation is growing almost every week, and the tendency of prices is upward. Agricultural conditions are thoroughly sound. Cotton, wheat, corn, and the other farm staples have yielded satisfactory crops, the railways are somewhat congested, even though the great crop movement to the seaboard has not yet fairly begun, and there is nowhere in the sky a speck of cloud to cast a shadow upon the prospect for an active and prosperous year. In these conditions, we believe, will be found the real explanation of the apparent indifference of the American people to the result of the great electoral contest to be settled on the 8th of November.

EUROPEAN buyers of American-made automobiles will be interested to know that in style, construction and price those vehicles for 1905 will not differ materially from those of the present year. This much was virtually settled at the recent meeting of the Association of Licensed Automobile Manufacturers in Buffalo, N. Y., at which twenty-four of the thirty affiliated manufacturing concerns in the United States were represented. It was shown at that meeting that the combined output of American automobile manufacturers for 1904 would number approximately 18,000 vehicles, and orders already booked and in sight indicate that the product for 1905 will number at least 30,000. The models for next year are already in hand, and in three-fourths of the factories the examples for 1905 will be ready for inspection early in January. All signs indicate an active and prosperous year in this branch of American industry, and in every department of it there is an eager desire to meet the requirements of foreign purchasers.

AMERICAN INFLUENCE IN FINANCE.

A LONG with the expansion of American trade and American territory during the last half dozen years there has been an increase of American influence in world-finance which is at once powerful and wholesome. Wherever American authority has been established in territory beyond the continental boundaries of the United States it has been followed by earnest and, on the whole, successful efforts to improve monetary standards and conditions. During the temporary occupation of Cuba by the United States the basis was laid for a monetary system founded on the gold standard which was eagerly adopted by the incoming Republic of Cuba. In Porto Rico, also, the gold standard is firmly established. It is in the Philippines, however, that we shall find the largest results of American financial influence. Before those islands passed under American control the Mexican silver dollar was the standard monetary unit, and owing to constant fluctuations in its value in the markets of the Orient credits were uncertain, prices were subject to swift and demoralizing variations, and trade was steadily growing from bad to worse. One of the most urgent duties of the United States Government when it took possession of the islands was to reorganize their fiscal system. It was a task of extraordinary difficulty. Business transactions up to that time had been conducted on a silver basis. To transfer the whole fiscal system of the archipelago to a gold basis without disturbing the usual current of trade, without working injury to vested interests and without impairing the validity of existing contracts was an undertaking which seemed almost impossible. Yet that undertaking has been successfully executed, and with so little inconvenience to private and public interests, that the performance must be recognized as one of the most creditable achievements of the whole American venture in the Philippines. An entirely new and distinctive system of silver coins, produced at American mints, has been provided for the islands, the unit being the peso, which has a definite value of 50 cents in gold. It has taken the place of the Mexican dollar as the monetary standard, one result being that about 45,000,000 Mexican dollars have been driven from circulation in the islands.

The effect of the establishment of the gold standard in the Philippine Archipelago is bound to be felt elsewhere in the Orient. As a matter of fact, the importance of the transaction is already keenly appreciated in China, where there is a manifest tendency toward gold. The Chinese Government has within the last year sought the counsel of an eminent American economist with reference to a transfer of the fiscal policy of the empire from a silver to a gold basis, and the opinion of that gentleman is that while the difficulties in the way are tremendous, the change will ultimately be effected. In Mexico also there is a pronounced movement in favor of the gold standard, an indication of which, perhaps, may be found in the fact that \$40,000,000 of Mexican national bonds recently sold to a banking firm in the city of New York, are specifically made payable in gold coin of the United States, this being the first time that Mexico has ever entered into an international financial arrangement based on such conditions.

We believe that it will be granted, after an impartial survey of the field, that wherever American financial influence is felt in other countries it is an honest and a wholesome influence. Its highest purpose is to safeguard the mutual interests of debtor and creditor, to simplify the complex mechanism of trade exchanges, to promote the growth of the world's commerce, and thus to add to the common welfare of mankind.

A MERICAN exporters of lumber, and particularly those whose specialty is yellow pine, nearly all look for a lively trade during the coming year. The feeling of buoyancy is manifest in every branch of the industry.

A MERICAN apples for export are now ready. The crop is abundant, the quality of the fruit is exceptionally high and the methods of packing show decided improvement.

PERIL TO A GREAT INDUSTRY.

IT is a disquieting fact that one of America's great manufacturing interests, the rubber industry, is threatened with grave embarrassment, if not with absolute starvation, by the exhaustion of its resources of raw material. The strange indifference with which the exhaustion of the rubber supply has been regarded in the trade has finally given way to a feeling of real concern, and manufacturers as well as the United States Government itself are eagerly seeking new sources of this important staple. The efforts of the Government seek to discover regions whose soil and climate will permit of scientific rubber culture, experts holding that it is only through such means that the industry can be saved from destruction. They point out that the increasing demand means the absolute exhaustion of all present known sources of supply, and that at the present rate the output will fall 40 per cent. below actual needs within two years.

The magnitude of the rubber business in the United States is so vast that the death of the industry from any cause would be a national business calamity. Its extent in one line is illustrated by the fact that a single corporation sold more than \$33,000,000 worth of rubber boots and shoes last year, in making which it used upwards of \$10,000,000 worth of crude rubber. The concern mentioned is but one of a dozen or more large buyers who are always in the market for raw material. Reports agree, however, that, while the demand is constantly growing, the output of crude rubber has reached the maximum, and is probably on the decline. The rubber gatherers have to go farther and farther into the jungle every year to find productive trees. Every year thousands of trees are denuded and destroyed by ignorant or greedy tapping. No concerted effort appears to be made except in a few instances to foster the trees on the orchard principle. Yet scientists agree that it is only by some such method that the needed supply of raw rubber can be insured for future use.

It is fortunate, therefore, that practical steps have at last been taken to protect the sources of this important commercial staple. Upon the success of these efforts depends the future of one of America's largest and most important manufacturing industries.

COUNTING THE COST OF WAR.

THE final session of the International Peace Congress at Boston, Mass., U. S. A., on October 8, 1904, was exceptionally interesting because of the presentation of a report by a special committee appointed at the Glasgow congress of 1901 to consider the economic causes of war. This report, representing a painstaking study of the whole question, extending over long periods and many countries, declared in effect that the fundamental causes of war are economic antagonisms, rather than race antipathies, clashing political systems or the mere greed for territory for its own sake. It was therefore suggested that an international study be made of all trades-union and trust movements, as well as of the general tendency of relations between labor and capital engaged in productive enterprise. This suggestion was adopted, together with a resolution urging the United States Government to compile and publish all available statistics bearing on the direct and indirect cost of wars, foreign and domestic, since 1800.

Without necessarily assenting to the proposition that wars have their origin in economic antagonisms, we are bound to say that the publication of war statistics, as proposed, would be an excellent thing. War is the cruellest and costliest of human follies, yet people rarely think about it until it is upon them. However, there are signs of an awakening. The military burdens of the great nations are increasing with such frightful rapidity that the aggregate, all representing the earnings of the producing classes, amounts almost to an impeachment of the reason, justice and moral rectitude of mankind. To place before every wage earner and every business man in Christendom an official statement of the cost, in life, money and productive energy of the wars of a century, might provoke a universal protest against any further increase in the armies and navies of the world. It would appear to be worth trying, anyhow.

OUR IMPROVING CONSULAR SERVICE.

THERE are evidences of improvement in the already excellent consular service of the United States which THE AMERICAN EXPORTER contemplates with unmeasured gratification. The efficiency of that service is so vital to the stability and growth of our trade interests abroad that the Government spares no expense to increase its usefulness. The functions of our consuls are more clearly defined than they formerly were; their tenure of office is more secure; their emoluments and privileges have been increased—and because of these changes the service is gradually developing into the great international business agency and bureau of information which it was meant to be. A foreign recognition of this improvement which is worthy of notice appears in an article in the *London Chamber of Commerce Journal*, which, somewhat reluctantly but none the less frankly, acknowledges that the consular service of the United States is superior to that of Great Britain. The American consul, the article continues, does far more to promote the trade of the United States than the British consul does to promote that of Great Britain, the American being encouraged in the initiative, a tendency which is studiously suppressed in the Britisher.

What our London contemporary has said on this question is extremely pleasing. Undoubtedly the United States Government has tried and is trying by every means in its power to develop a consular system which shall be capable of the largest possible usefulness alike to the American producer and the foreign buyer of his goods. To that end it is required that our consuls shall be men of unquestionable integrity, broad intelligence and large experience in practical business affairs. The consular service can no longer be treated as a sort of snug harbor for men who have failed or become superannuated in other vocations at home. On the contrary, it needs successful men who are yet in their prime, who have more than a mere pecuniary interest in their mission and who are eager to serve to the utmost of their ability the commercial interests of their country in the large and honorable field to which they are assigned. Happily, there is reason to believe that men of this class are entering more and more largely into our consular service. There is room for them, but none for incompetents. The whole service is gradually being transferred to a merit basis, under which the fit and capable will enjoy steady advancement, while the corrupt and incapable will surely be eliminated.

But after all is said and done, the most trustworthy judge of the efficiency of our consuls is the foreign buyer of American goods who seeks his assistance in reaching the producer in the United States. The United States consul who ignores or inadequately responds to a request for information of the nature mentioned, or who is only half-hearted in his efforts to place foreign purchasers in communication with American manufacturers of any indicated class, fails in the most important duty of his office and is utterly unfit for the service. Foreign dealers in American products should keep constantly in mind that the United States consuls in their respective districts are there to be useful to them, not as a favor but as a duty. The consul who, because of any mistaken idea of his office, fails once in that respect, thereby gravely impairs his capacity for usefulness.

AN UNJUST INTERFERENCE.

THE seizure of the British ship *Colchas* by the Russians off the coast of Japan in July of the present year has developed a question of real concern to other nations. Included in the cargo of the *Colchas* were large amounts of naval matter, much of it in sealed pouches. All this matter was opened and examined by the Russian authorities on the ground that it contained information of value to Japan. Part of the mail was subsequently forwarded to the addressees, but a great deal of it was destroyed. This proceeding, we repeat, is a matter of grave importance to the commercial world. The inviolability of mails in transit in time of war is affirmed both by international law and the international postal treaty. It is held that while mails found on ships which have been lawfully seized

or captured may be examined under certain conditions, the confiscation of such mail is justified only when it is clearly shown to be of military value to an enemy. The international rule guaranteeing the safe transmission of private correspondence in time of war necessarily implies the inviolability of mails on neutral ships passing to and from the ports of a belligerent country. That was the status of the United States mails on the *Colchas*.

Apart, however, from its repudiation of a principle which modern nations have formally recognized as binding, the action of the Russians in the case of the *Colchas* has brought about another result, which is no less displeasing. Because of the seizure of the vessel named, the owners of the line to which she belongs have notified the United States Government that they will carry no more American mails to Japan during the continuance of the present war. The situation, therefore, is just this: Through no fault of its own, but solely because of the arbitrary act of another government, the United States is to be indefinitely deprived of a neutral line of communication with a nation with which it is at peace, and which it has employed solely in the ordinary transactions of trade and commerce. Such an interruption of the legitimate trade of friendly nations by the act of a single belligerent is contrary not only to international law and usage, but to the spirit of the times. It is fraught with such evil consequences to the inoffensive commerce of the world that we have no doubt Russia will be persuaded to recede from her position—a position which is at once untenable and perilous.

AMERICAN VEHICLES ABROAD.

SIR ALFRED HARMSWORTH, of London, remarked during his recent sojourn in the United States that, after seeing what had been done to perfect and popularize the automobile in America, he was surprised that any foreign-made vehicle of that type should be imported into the United States. This recalls the fact that at the recent annual meeting of a British association of carriage manufacturers the chairman of the organization frankly declared that the English export trade in carriages had almost wholly disappeared. The American, the speaker went on to say, has taken the British colonial market for his own, and the proof of his having been there was to be found in the mark his touch had left upon the style, shape and construction of colonial carriages.

The gentlemen quoted above clearly perceive one of the most powerful tendencies in the American vehicle industry. The Australians frankly avow their preference for American-built carriages and wagons, and for the simple reason that those vehicles are better adapted for use in their countries than any made elsewhere. The development of American vehicles for road use has been distinctly logical. The roads of the United States until a few years ago were distinctly bad, and are none too good, even now. The American maker, therefore, was required to produce wagons and carriages which, first of all, had to be able to endure a vast amount of wear and tear. Having done that, his next task was to combine lightness with strength, eliminating all needless weight but without sacrificing the smallest degree of durability. In the vehicles thus evolved, adapted as far as possible to the poor roads of the United States, the keen-eyed British colonist found precisely what he needed for service in regions where physical conditions were relatively the same. There is the secret of the steady demand for American vehicles in the British colonies. It is expressed in two words: Merit, Adaptability.

Sir Alfred Harmsworth's remark as to the development of the automobile in the United States was amply warranted by the facts. The manufacture of motor vehicles in America is still in its infancy, but its growth is rapid and increasing, and it has already entered the export field. That American-made automobiles are destined to share in foreign countries the high repute so fairly earned by American carriages and wagons seems to admit of no doubt whatever.

ITALY, we understand, has planned to forestall any invasion of that country by installing a large iron plant with American equipment. Our Italian friends are wise.

FIRST AID SERVICE ON RAILWAYS.

WITH a view to providing prompt "first aid to the injured" among passengers using its lines, one of the foremost railway companies in the United States of America has instituted a system which seems likely to prove highly useful. In pursuance of this plan, all baggage cars, express cars, construction cars and wrecking cars belonging to the company, together with its car-yards, shops, offices and stations, are to be equipped with stretchers and "first aid" boxes, and these appliances are to be placed under the control of employees who have been thoroughly trained in the "first aid" service. This instruction will be given by the regular surgeons of the company to all men employed on passenger and freight trains, and will cover the primary treatment required for wounds, fractures, burns, scalding, shock and prostration by heat. Each car included in the system will be provided with a sealed box containing six "first aid" packages, and it is intended to train employees in their use so thoroughly that in case of accident the contents of the packages can be applied as intelligently and promptly as by the average surgeon or nurse.

This adaptation of the "first aid" system to the railway service in the United States is a new departure, and will undoubtedly prove a beneficent one. The same system has already been established in many large manufacturing plants in America, where it is conducted by employees regularly instructed in its application. Its gradual extension to establishments engaging large numbers of operatives affords striking testimony to the increasing regard of employers for the welfare of their employees, and it also illustrates the increasing humane tendency of our modern industrial life.

THE HAGUE CONGRESS CALLED.

IN conformity with his voluntary promise to the members of the Interparliamentary Union who recently visited him in Washington, the President of the United States on October 25th issued a note to each of the powers which signed the original Treaty of The Hague, inviting them to name representatives to meet in another conference for the purpose of broadening and strengthening the original agreement, and especially to consider means to further ameliorate the horrors of modern warfare and to conserve and extend the rights of neutral commerce on the high seas. It is a particularly gratifying circumstance that this invitation is extended not only to the nations which participated in the first conference at The Hague, but also to four of the Republics of Central and South America which have signified a desire to adhere to The Hague Treaty, but which have thus far been prevented from doing so by the singular omission from that treaty of a general clause, usually contained in such compacts, allowing other nations to adhere thereto on their own application.

It is specially appropriate that this call for a second conference at The Hague should be issued by the United States of America. The United States Government is pledged by tradition, pledge, precedent and unbroken usage to support to the utmost of its ability every movement to advance the interests of international peace and dispense as far as possible with the harsh processes of war in the adjustment of controversies among nations. Every measure to effect that humane purpose has uniformly received and will continue to receive the active sympathy and support of the Government at Washington. The good faith of the United States in the integrity of the International Court of Arbitration created by the first conference at The Hague, is shown by the fact that the United States was a party to each of the international controversies since submitted to that tribunal, and in each instance represented that that body was precisely the one best qualified to adjust the matters in dispute.

That the United States should take the initiative toward a second conference at The Hague is gratifying for another and scarcely less important reason. The war in the Far East has disclosed grave differences of opinion between Russia and various other nations, including the United States, regarding the rights of neutral commerce, and also as to what legitimately constitutes contraband of war. Because of Russia's insistence upon conditions which the United States and other powers do not concede, neutral commerce passing to the

ports of Japan has been seriously interrupted and endangered. This interference is so serious, indeed, that neutral ships bearing neutral cargoes intended for inoffensive industries in Japan are in peril of seizure on Russia's own definition of their rights and privileges. In a word, Russia dissents from the views of nearly all other nations as to the rights of neutral commerce, and as a nation at-war is a law unto itself, there is nothing to do but to appeal to her on the broad grounds of reason and international amity. The war was clearly shown the need of a broad-gauge revision of all international agreements relating to neutral commerce and contraband of war. What is needed is an arrangement, accepted in good faith by all maritime nations, whereby neutral ships bearing neutral cargoes not intended for the military use of an enemy shall have safe access to the ports of a belligerent country. That war between two nations should be permitted to suppress peaceful commerce between either of them and other countries is monstrous, yet that condition has virtually arisen from the present conflict in the Far East.

To correct this gross injustice and bring all the great powers into a common agreement that neutral commerce shall be free from interference in time of war is one of the honorable tasks awaiting the second conference at The Hague. If that result shall be accomplished, as it should be, as it can be and as we fondly hope it may be, the proceeding will be recognized throughout the world as a distinct triumph of wise statesmanship in behalf of commerce, humanity and civilization.

THE meeting in New York on October 24th of the British Iron and Steel Institute was an international event which happily illustrated the steady growth of fraternal relations between the two great branches of the English-speaking race. The presence of the members of the British Institute in the United States was heartily welcome. Its members, representing the dominant forces in Europe of the greatest of modern industries, found that in all its branches the manufacture of iron and steel in America had made enormous strides since their first meeting in the United States in 1890. They found that in productive capacity the United States had taken first place among the nations; that in magnitude, method and thoroughness of equipment the steel plants of America surpass all others in the world, and that the control of the steel industry and its related interests has been permanently transferred to the western hemisphere. The business community of the United States delighted to honor the distinguished men composing the British Institute. They deserved all that could be offered in the way of American hospitality, and their visit, helpful as it will doubtless be to themselves and their entertainers, will be notable among the events of a year which has been made memorable in the United States by the conventions of many distinguished international associations.

THAT familiarity breeds contempt is a true adage few will be disposed to dispute, and perhaps it has no better illustration than in the matter-of-course way in which Americans use our everyday business home and social life appliances and devices undreamed of a few years ago. The telephone is a notable example. It is only a generation ago, in 1876, that the telephone was exhibited at the American Centennial Exposition in Philadelphia as a sort of scientific curiosity. Since then it has grown into a great and valuable public utility without whose aid it would seem to be impossible to carry on our daily life. It is, perhaps, even a greater help in its adaptability to the requirements of modern life than the telegraph, and that its control and management form an industry of no small importance is shown by the following brief statistics. Without taking into account private telephone lines, some \$274,000,000 is invested in concerns which supply this service to the public in this country; \$75,000,000 in bonds have been created by these corporations and about 65,000 people are employed by them. There are almost 2,500,000 telephones in use in the United States, and in 1903 more than 5,000,000,000 messages were transmitted.

LARGE orders for tin plate have been placed with American manufacturers by the Japanese Government. It is stated that this material will be used in making various utensils for the Japanese troops in the field.

NEW YORK'S GREAT SUBWAY.

WITH the formal opening of traffic in the New York Subway on October 27th the touch of completion was given to a project which, while realizing a half-century dream of the American metropolis, also takes a place among the most splendid engineering triumphs of modern times. In its magnitude, the public utility and the methods employed in its excavation it is a matter of international scientific interest, and for that reason THE AMERICAN EXPORTER feels called upon to place before its readers some account of this remarkable undertaking.

The physical environment of New York is unlike that of any other great city in the world. Built on a long, narrow island of rock, surrounded by waters particularly difficult of navigation, its increasing population long ago necessarily began to overflow into the vacant spaces to the east, west and north. This movement, compelling hundreds of thousands of persons to establish houses at points ranging all the way from two miles to twenty miles distant from their places of business in the city, has for years distinguished the question of local transportation as perhaps the most important of all municipal problems. The demand for safe, cheap, speedy and uninterrupted transit among all points in the city and its immediate outskirts was fairly met for a time by the efficient operation of extensive systems of passenger railway on the surface and above the surface of the streets. But the city soon outgrew those facilities, and far-sighted citizens realized years ago that the only practical solution of the problem lay in the construction of a vast system of underground road. The undertaking was so colossal, however, and involved such an enormous outlay of capital and so many difficult tasks in engineering that private capital shrank from it. A long period of inaction followed, and it was only after the city, under special authority, awarded a contract for the construction of the work for \$35,000,000 that the project took form. Under the terms of that agreement the contractor acquired the right to operate the system for fifty years, on condition that at the end of that period the subway should become the property of the city without cost, the equipment also to pass on a fair appraisal of its value.

Under the terms of the contract work on the subway began March 24, 1900, and has continued night and day ever since, save for occasional interruptions by labor troubles and other difficulties. Yet so systematically has this tremendous work been carried on that except in a few instances where construction was peculiarly difficult, the vast street surface traffic has gone ahead as usual and business operations have suffered but little interference. Even in Broadway, the great business artery of the city, under which the subway extends for miles, and where the work of excavation was of the most difficult character, the pedestrian, unless he knew it, would never have dreamed that away below the surface, far lower than the foundations of many of the lofty "sky-scraper" buildings an army of men were laboriously blasting through almost flint-like rock a tunnel capable of affording passage for modern railway trains.

While statistics are usually tedious, they have a descriptive power as applied to this enterprise which, in part at least, will excuse their use: The lines of the subway now in use comprise about thirteen miles of double track, extending north and south, for which there are thirty-one stations. An average of 10,000 men were at work on this system for more than four years. It was necessary to excavate about 3,212,000 cubic yards of material, of which 1,900,000 cubic yards was earth, and 1,312,000 cubic yards of rock had to be blasted in open cut and in the tunnels. The rock thus removed would make a structure 500 miles long, with the height and thickness of the Great Wall of China. The timber used in "false work" would supply the lumber for 10,000 frame houses of two stories each. In construction work 65,000 tons of steel were used and 8,000 tons of cast iron. There was laid 551,000 yards of concrete and 910,000 yards of waterproofing. The total length of track laid is 305,000 feet, of which 245,000 feet is underground and 60,000 feet is on elevated structures. At some points the tracks are 20 feet above the surface, at others 200 feet below.

Briefly described, the subway was built thus: The top, sides and bottom were constructed of concrete and waterproofing in alternate layers, encasing a framework of steel beams. The roof is supported by steel pillars not more than five feet apart and set in parallel rows in the concrete of the top and bottom. The subway is therefore a long, rectangular hole, thoroughly waterproofed. Its shallowness makes it possible to do away with artificial ventilation. Enough air enters at the stations to keep the tunnel fresh and sweet, and the rush of cars is counted upon to keep the air in motion. When the tunnel was driven upward close to the surface all water-pipes, gas-pipes and sewers met had to be removed and replaced or diverted. As the pipes were encountered, they were hung up by chains to the timbers supporting the street. Engineers declared that it would be impossible to blast out rock from beneath these pipes without smashing them; and they came from far and near to see the thing done. It was done. The dynamite explosions expended their force, and all danger from flying pieces of rock was prevented by the use of great thick mats woven from rope, which were laid over the sections of rock to be blasted. As the pipes, however, could not be left in their former criss-crossed maze, forty-five miles of new pipes were laid down. As an indirect result of the building of the subway, the city's underground pipes along its course have emerged from chaos into order.

Dozens of miles of sewers had to be rebuilt. In one aspect the driving of a trench through New York's streets was a bit of exploration disclosing unexpected conditions. The city's sewers were found to be in a decidedly un-

economic tangle. Some were too large for their purposes, some too small. One sewer would be found to run above another instead of into it. In one place the water-pipes, thickly incrusting with filth, were found running straight through a sewer. The engineers of one era of the city's development had built the sewers that contemporary conditions called for; their successors had added others quite unrelated to the earlier ones. Because of labor troubles the contractors built many of the new sewers of concrete, which are so thorough in workmanship and durability that they have set a new standard of excellence in municipal work of that character.

The stations of the subway are models of cleanliness, comfort, convenience and artistic taste. Each station has a distinguishing color scheme, so that a passenger can tell at a glance from his car whether he has reached his station, even if he cannot see a sign. New York streets have always proved a bane to strangers—for they are hard to identify, and they frequently lack signs. The subway stations remove this difficulty; each tells, by numbers, letters and symbols in every corner and in every detail what station it is. And the decorations which give this explanation are at many stations beautiful, and at all stations pleasing. Rookwood pottery, faience and marble are used in many tints and in countless designs. Never before has tiling been used on so vast a scale. Indeed, the general effect of a ride through the tunnel will be that of buzzing through a broad, airy passage, and flashing now and then into commodious, well-lighted rooms, offering a kaleidoscopic variety of color. Glass roofs provide the stations with plenty of light—which is diffused from the glazed tiles—and the platforms are broad enough to accommodate great crowds. Inconspicuous hooded entrances and exits—little kiosks of sheet-iron and glass—rising from the sidewalk, show where the subway stations are. And these are not placed on the main avenues, where the subway runs, but a few feet from the corner, down the side streets.

The motive power used in the subway is electricity, applied to the third-rail system. The principal power-house is 700 feet long, 200 feet wide and 125 feet high. The weight of the steel framework alone is about 12,000 tons. The total generating capacity of the plant is about 130,000 horse-power. The coal bunkers have a capacity of 18,000 tons. Nine engines, together with the turbo-generating plant, give from 80,000 to 100,000 horse-power. The engines are of the twin compound type and require six boilers for each engine.

The cars for the subway, 500 of which have already been tested, are built of steel and are each 52 feet in length, with a capacity for seating fifty-four people and carrying 100. All the cars are sheathed in copper and are very strongly built. The roof of the car slopes toward the top so as to conform to the arch of the subway. The constructive features of both the parlor and ordinary cars are similar, but in the details of lighting and finish they differ. All non-metallic substances used in building the cars have been chemically treated, so as to render them non-combustible; they are also impervious to moisture and do not warp or crack. The electric wiring is protected against fire with the latest devices. The center sills of the cars are of compound construction with cross-trussings between the steel needle-beams and the platforms. The sills are of steel with heavy anti-telescoping plates. The platform posts, which extend upward to the roof, are made of heavy steel bar at the corners and center of platforms. They are bolted to the steel sills, to the steel floor plate and also to the hooded roofs, forming a heavy steel angle in one piece reaching from plate to plate, and extending back into the car body 6 feet on either side. The floors of the cars are double, with asbestos fire-felt between, and the floor on the other side covered with three-sixteenth-inch asbestos "transite board." The cars have half-Empire roofs with light-colored ceilings. The ventilating sashes are opened by a lever, those on each side being divided into two sets, the first set admitting fresh air, and those in the rear of the car allowing the foul air to escape. All the cars have the automatic drawbar coupling and automatic air-brakes. The cars are vestibuled, and when made up into trains each car can be closed, so as to be entirely distinct from the other.

In operating the road express will consist of eight cars and local lines of four cars. During the "rush hours" of the morning and evening express trains will run on a two-minute headway and local on a one-minute headway. The maximum carrying capacity of the system is 100,000 passengers every hour, day and night.

Runners for Wheeled Vehicles.

AN ingenious contrivance invented by a manufacturer in the State of Ohio, U. S. A., is in the form of a runner for wheeled vehicles, designed as an apparatus of direct attachment to the wheels, whereby it may be used when snow is upon the ground. The utility of such a device is quite obvious. The runners are made from a single piece of steel, extending underneath the full length of both wheels, or a separate runner may be utilized for each individual wheel if desired. The forward end of each runner is upwardly curved similar to the form usually found in sleighs. From the runner extends a movable steel band adapted to partially encircle the rim of each wheel. This band is secured to the tire by means of retaining lugs placed at intervals, and is arranged at one end with an adjusting device which makes it adaptable to any sized wheel. The wheel of the vehicle rests in a concaved notch of the runner, and as the band is adjusted and tightened the wheel is securely locked into position. The salient feature of this invention is the convenience with which a wheeled vehicle may be converted into a sleigh for ready use with snow. When not in use the apparatus may be folded into a compact space.

Automatic Telephone Exchanges.

AFTER years of experiment, the automatic telephone exchange, whereby the subscriber places himself in communication with other subscribers without human assistance at the central exchange, is an accomplished fact and is rapidly entering into commercial use in the United States of America. This new system has proved completely successful, and the business of the largest city can be handled as efficiently and conveniently as that of a town which requires but a hundred telephones. For instance, in the single city of Chicago, Ill., U. S. A., an automatic exchange with 10,000 telephones is already in operation, and others will be added as occasion demands, the ultimate purpose being to handle the business of the entire city.

While the subject is largely a technical one, even the non-technical reader may derive some idea of this new system from the following description: The automatic telephone itself resembles, in many particulars, the manually operated telephones with which we are so familiar. It consists of the usual transmitter, receiver, bells, battery and induction coil, adding only a calling dial, a circular metal piece, on the periphery of which are ten finger-holes, numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. A stop is provided at the lower of the holes to limit the distance which the dial may be made to revolve.

The method of calling is extremely simple. To secure a number, say 761, the subscriber first takes the receiver from the hook; then, placing his finger in hole No. 7, pulls the dial around to the stop above mentioned. When released, the dial is instantaneously restored to its normal position. The subscriber is now connected to a trunk line leading to the seventh group of so-called "connector" switches, which we may call the "seven hundredth" group. In the same manner he calls 6 and 1 in this group. Having turned the number desired, he presses a button underneath the dial, which rings the bell of the person wanted, and the connection is completed. In the event that the 'phone of the subscriber called is busy at the time of the call a vibratory sound in the receiver of the caller notifies him that such is the case.

The keyboard of internal mechanism of the telephone occupies a space 5x3x2 inches, and consists of an impulse-sending mechanism, which, in response to the rotations of the dial, communicates to the subscriber's switch a number of impulses corresponding to the number of the hole in which the finger is placed, lifting the shaft which occupies the central position of the switch, up to the proper row of contacts and bringing the "wiping fingers" fastened thereto into connection with the proper contact in that row.

It should be understood that, when the call is made, no impulses are sent over the line on the down movement of the dial, but on the return. This is arranged for the protection of the instrument against careless or hasty subscribers. The return of the dial is regulated by a governor, which always insures proper speed. The calling mechanism may be said to be perfect. It is simple, and works with remarkable accuracy, speed and precision.

Increasing Use of Aluminum.

WHILE the commercial use of aluminum in the United States of America has not grown as rapidly as was expected ten or twelve years ago, present conditions indicate a steadily enlarging market for that wonderfully adaptable metal. It is already used in the manufacture of many attractive articles for household use, including combs, hairpins, trays, etc., as well as kitchen utensils for which it is peculiarly suited because of its cleanliness and durability. But its most valuable use is in electric construction and transmission. Aluminum has 62 per cent. of the electrical conductivity of copper. Hence a wire about one-eighth larger in diameter than a copper wire will conduct equally well, and at the same time will weigh less than half as much. At the present price of the metals aluminum is considerably less costly, and the lighter wires may be supported by poles placed farther apart than is safe in the case of copper. Many power-transmission lines are already using aluminum, and most of those in course of construction are employing it. In the State of Connecticut, for example, 2,000 horse-power of electricity for lighting purposes is transmitted eleven miles over an aluminum line.

Steel-making also absorbs large quantities of aluminum, the metal being used as a deoxidizing agent in the Bessemer and Siemens-Martin processes. At present the annual product in the United States is about 7,150,000 pounds, and increasing rapidly, the selling price of the metal being so low that, bulk for bulk, it is the cheapest metal produced, except iron, steel and zinc. As an example of an industry entirely developed by scientific research aluminum production is of deep interest. The career of the metal as an industrial factor is evidently just begun.

Machine to Pick Cotton.

THE fact that picking cotton is perhaps the largest item of expense in producing that staple has inspired many attempts to invent a machine capable of performing that work, but of all the devices meant for the purpose none has achieved any considerable success. There is a good deal of promise, however, in a machine recently invented by a planter in the State of Georgia, U. S. A., in which a current of air is set up in a tube by means of a suitably arranged fan or blower, the same discharging into a receptacle, the suction thus produced serving to remove from the plants the open bolls of cotton which are ready for picking, and to convey them through a tubular conduit and then through the blower mechanism into the receptacle. This apparatus is mounted on wheels and is designed to be driven down the rows of cotton plants in the field. As the end of the suction tube passes over the open bolls the cotton is separated from the plant.

Enormous Rafts in the Pacific.

TO tow for hundreds of miles at sea colossal rafts of logs containing in some cases 1,000,000 lineal feet of piling was formerly considered a hazardous undertaking, but it is now done with ease in the far Northwestern regions of the United States of America which border on the Pacific Ocean. In the summer season dozens of such rafts are towed from the States of Oregon and Washington to San Francisco and other ports of California, the voyage requiring sometimes as much as three weeks.

One of these rafts contains as many as 20,000 logs or piles, each ranging from 80 to 110 feet in length. The girth of the raft is often 600 feet around the center. All the rafts are built in the form of a mighty cigar, or barrel, tapering gradually each way from the middle. They are constructed in a great "cradle" that is moored in shallow water near shore. This cradle resembles the framework of an immense wooden vessel, having a double keel and built of heavy timbers with strong knee-braces between the floor timbers and the verticals at a point which in a vessel would be called the bilge. The keel is made in two sections, which are held together by massive locks and clamps while the raft is being constructed. The piles forming the raft are very long, and to make a strong, and at the same time flexible, structure out of pieces of such comparative shortness is a work requiring much skill. The piles are placed in one by one with a derrick in such a manner as to "break the joints" as much as possible. And thus the work progresses.

After the raft is thus built in the cradle it is wrapped around with cable of 1½-inch iron chain at intervals of every 12 feet. While this cable-wrapping holds the mighty mass in a firm embrace, it does not deprive it of a certain necessary flexibility. Extending from end to end of the cigar-shaped raft, and right through its center, are two 2-inch chains, one holding the bulkheads at each end in place, and the other being fastened to the hawser. From the towing chain, lateral chains running from the center connect with the encircling bands. So it is possible to apply a steady strain in towing; for, the stronger the pull the tighter the logs are clutched together.

Then the mighty raft and cradle are pulled out into deeper water. The massive locks of the embracing cradle are opened by pulling the ropes connecting the parts; the two sections of the cradle float apart and the giant "baby" is committed to the waters and ready to tow away seaward. The tug or tugs steam away cautiously, moving slowly and keeping a steady, heavy strain on the mass. In the event of head winds and strong seas the tugs merely "hold on," keeping the vast bulk astern steady, until wind and waters abate their strenuousness.

Some of these huge rafts—those first constructed—have gone to pieces out at sea in boisterous weather and the myriads of piles are scattered for hundreds of miles up and down the coast. These piles are a serious menace to all coastwise navigation. The later rafts, however, have been so securely built as to be able to withstand a rough ocean trip.

Worst Enemy of American Cotton.

THAT the future of one of the great staple crops of the United States of America should be seriously imperiled by a tiny insect scarcely larger than the common house-fly seems almost inconceivable, yet it is a fact to which the Government, planters and scientists are giving their earnest attention. According to statistics compiled by the Census Bureau of the United States, this insect, known as the boll-weevil, last year destroyed 739,360 bales of cotton, worth more than \$36,000,000, in the single State of Texas. To this the value of the seed must be added, and the Census Bureau, after exhaustive research, fixes the total loss at \$49,272,989.61. This represents the damage for only one year, it must be remembered, and the weevil has been in Texas more than ten years. The total value of the agricultural products of the United States is, approximately, \$5,000,000,000 each year. The total loss from the operations of destructive insects ranges from \$300,000,000 to \$400,000,000 per year. It may be averaged at \$350,000,000, or 7 per cent. The loss in cotton last year, therefore, was, approximately, one-seventh of the total loss sustained by all the crops of the country, and since the whole value of the cotton crop, roughly speaking, is \$500,000,000 annually, or one-tenth the total value of all agricultural products, it will be seen that the damage to the South's principle staple was proportionately heavier than to the others—a fact that is all the more significant, when it is remembered that the burden fell on the planters of a single State.

The Texas Legislature last winter appropriated \$50,000 to be given as a prize to any one bringing forward a practical and effectual method of getting rid of the troublesome and costly bug. A commission was created and its members made trips through the State to inspect the actual workings of many of the plans submitted. That was months ago and the \$50,000 is still untouched.

The United States Department of Agriculture has spent years and hundreds of thousands of dollars in seeking a means of exterminating this destructive pest, but without success. It is now making extensive experiments with a species of carnivorous ant, which is said to prey upon the weevil.

Enormous Street Railway Traffic.—The magnitude of street railway traffic in American cities is indicated by the fact that last year the surface lines in Philadelphia, Pa., U. S. A., carried nearly 400,000,000 passengers and received \$15,923,507 in fares. In the same city during the year 1,276 miles of new track were laid, 940 miles of which were an entirely new road.

Motor Boats in Coast Fisheries.

ONE of the most notable economic changes following the increasing use of the combustion engine is found in the employment of motor-driven boats in the coast fisheries of the United States of America to the profit of the enterprising fishermen and to the equal advantage of the consumer in the large cities. By means of motor-driven boats the fisherman is able to quickly take his catch to market or to a point at which steamboat or railroad will take it the remainder of the distance, so that his fish are fresh when displayed to the consumer in the city markets and the price received and the amount of fish sold are naturally greater than under the old conditions, when wind and weather governed delivery. It is interesting to look over the craft in any one of the hundreds of places along the coast where fishing is an industry and note the adaptation of the combustion engine, generally of the gasoline type, but sometimes using petroleum. Fine new launches with deck cabins are in sharp contrast to the open dory, seaworthy and rather fast, or to the well-rounded catboat, denuded of mast and sail, that the gasoline or kerosene may be more sure to accomplish the certain arrival at fishing-ground or market. Just as the old-fashioned farmer has adopted the little engine to do his work, so has the old-time fisherman taken advantage of the progress of the motor and makes money out of it. Fishermen in the waters which supply the great city of New York with sea-food now with power craft can get their catch to market in less than half the time it used to take with sailboats. One little group of such fishermen cleaned up \$5,000 above a season's living expenses for themselves and families because they had a 50-foot naphtha launch to make the daily run of a dozen miles to Newport. Under old conditions of delivery by catboat or sloop the profits were but a small part of the present earnings.

In this connection it is well to consider the possibilities of the application of the combustion motor to the deep-sea fishing fleet. Auxiliary fishing vessels are already in use with engines intended for operation only when the wind fails. But the day is coming, many believe, when the sail will be the auxiliary and the motor the main source of motive power for this class of vessels. The present objection is the element of uncertainty that exists with the motor boat, especially in the sparking arrangement, which has a tendency to get out of adjustment unless handled skilfully. The strain is great, as it is in the automobile, and it makes more difference when the breakdown occurs on the water than it does on land. On the other hand, the development of the combustion motor has been exceedingly rapid, and probably the motor of 1904 has developed very few weaknesses, compared with those produced in previous years. Each succeeding year will bring more perfect results, naturally, until the combustion engine will be as perfectly reliable as the engine of steam. If serious attempt is made to earn the \$2,000 prize offered by M. Charley, the French enthusiast, for the first motor boat to cross the Atlantic on its own keel and under its own power, an opportunity will be given to study the question of deep-sea navigation for this class of boats. The principal objection appears to be the fuel-carrying capacity of the boats. Yet, in commercial use, with much heavier vessels than those used for trials of speed, the fuel question may be as satisfactorily solved as in steamships burning oil for fuel.

Evolution of the Typewriter.

TYPEWRITING machines, particularly those of American make, have entered so largely into the office work of the business world that it seems almost incredible that so recently as 1882 only about 1,500 machines of a leading design were placed on the market annually; yet that statement is made by one of the foremost technical journals of the United States. Since then, however, the popularity of the typewriter has become such that at the present time a finished machine is being produced for every five minutes of the working day.

There have been many curious and beautiful machines constructed from time to time to the order of various people, or for presentation. Perhaps the most elaborate typewriter ever produced was that made for the Czarina of Russia. All parts of the machine ordinarily black were enameled blue, and those portions of the framework usually outlined in gold were inlaid with mother-of-pearl. The keys were of African ivory and the bright parts of solid gold. A similar machine was presented on her wedding day to the present Duchess of Wales, then Duchess of York, and another was made not long ago to the order of the Khedive of Egypt. The King of England possesses an exceedingly elaborate typewriter. It is ivory-keyed, gold-plated throughout and very beautifully engraved. An extraordinary machine was that made for Li Hung Chang. It was fitted with twenty sets of characters—1,800 in all—each of which, as no dies were available, had to be turned out by hand.

A somewhat expensive machine was built for the use at Eton School, in England, of the young son of the Countess of Carnarvon. It writes the Greek alphabet, and is used by the boy, whose eyesight is somewhat weak, in preparing his lessons. This is believed to be the only Greek typewriter ever made, but machines for writing Russian are fairly common, a certain well-known American firm having recently supplied a large order for typewriters for government offices in the land of the Czar. Machines have been built to order for writing Arabic, Sanscrit, and even old, black-letter English. Only one of the last-named was ever made, so far as can be ascertained. It cost nearly \$500, and was made for a mysterious individual, who paid cash in advance and declined to furnish either his name or address.

Queer Locomotives for Japan.

A CONSIDERABLE number of locomotives of peculiar design for use in Japan are under construction in the shops of a great manufacturing concern in Philadelphia, Pa., U. S. A., and several of them are ready for shipment. To all appearances the tiny locomotives are peaceful-looking enough. As the one now completed stands in the shops, almost lost to view in the shadow of monsters of American railroads, it suggests an infant in the presence of Titans. It is so small that its weight is given in pounds instead of tons. The little engine scales 2,500 pounds, which is about the weight of an automobile of the "Red Devil" variety. If the engine gets in the sulks and refuses to budge the Japs can easily tow it out of the road. It is a handy little affair, easy-running, easily managed.

There is just about room for one man in the tiny cab. Sitting on the solitary seat he can reach every part of the starting and stopping gear without getting up. If he be dextrous he can fire the engine without rising also, for the firebox is within arm's reach. A canopy, open at the sides, covers both cab and engine, and the side plates almost hide from view the diminutive driving-wheels.

The little engine is intended for use on narrow-gauge railroads, of which there are many in Japan. In any other country the work that the little locomotive is to do would be done by horses, but these useful animals being scarce in the Mikado's realm most of the transportation has been in the hands of the vast army of coolies employed in a carrying capacity by the Japanese. To facilitate the operations of these coolies the Japanese have built hundreds of miles of narrow-gauge railroads, and along these the merchandise and produce of the country have been propelled, not by engines, or even cattle; but by hand power. Coolie labor is cheap in the Orient, but intelligent Japanese who have traveled conceived a better way of transporting merchandise than in pushing it along a railroad by hand.

The tiny railroads being already built it was only necessary to provide locomotives to fit them, and this proposition was made to the Philadelphia company: that they build a locomotive to fit the gauge of the coolie railroads, each locomotive being large enough and strong enough to do the work of two coolies. The little engine now in readiness for work in Japan is the result of the designers' ingenuity. It will probably be found to do the work, not of two coolies, but of half a dozen at least, for it is a powerful little machine.

The baby locomotive will transform the scene on Japanese plantations. The custom has been to load the tiny trucks with tea, rice or whatever products the plantation produces, and then shoulder them along the narrow-gauge rails. When a hill was reached the coolies put forth their utmost efforts, perspiringly pushed the train to the top and then rode while it reached the bottom by the force of gravitation. After that they would leisurely shoulder it along again. It was slow work and trying to the coolies. The Japanese complain that the coolies catch cold and die very easily from getting in a red-hot perspiration while shoving the train to the top and then becoming chilled while the train runs down the other side. All things considered, it is thought that the new engine will prove more economical as well as more useful than the coolie power.

Submarine Boats for Russia.

THERE is excellent authority for stating that at least thirty of the fifty submarine torpedo-boats recently ordered by the Russian Government will be built in the United States of America. In fact, unofficial information has been received in the city of Washington, to the effect that four vessels of that type under construction in the United States are nearing completion and will soon be ready for shipment. They will be taken apart and shipped in sections. Ten or twelve other boats of the same kind are under way at various American shipyards, and it is said that several are already on their way to Russian ports in neutral vessels. One American submarine of a new type was shipped to Russia some months ago, and reports recently received in Washington from official sources indicate that at recent tests near St. Petersburg the boat's performance was considered remarkable.

The shipment of these boats from American ports to a belligerent power has brought up the question of whether the United States Government, by permitting such shipments, is violating its neutrality obligations. In reply to that question it is pointed out that the American Government more than thirty years ago took and has since maintained the position that a torpedo-boat craft which could not cross the seas under her own steam, but which had been taken apart and shipped on a neutral vessel, was, to all intents and purposes, merely merchandise. Such "merchandise" is, of course, by its very motive contraband of war and subject to seizure, but that fact by no means proves that its shipment from American ports amounts to a breach of neutrality. Officers of the United States Government declare that even if official statements should be made to the State Department by representatives of the belligerent powers concerning the shipment of such craft to Russia or Japan, it is doubtful whether any action could be taken. It is understood to be the view of those in authority that if the submarines are taken apart, crated and shipped on a neutral vessel, which must take her chances of capture and confiscation or destruction, it would not be possible for the United States to take action in the matter.

Successful Weeding Machine.—An American firm has placed on the market a weeding machine which is said to keep gardens freer from weeds than could possibly be done by hand labor in the old, back-breaking way.

Ships That Do Not Return.

IN last month's number THE AMERICAN EXPORTER described briefly "a boat that digs its own canal," the vessel being one used in operations of gold mining in the desert regions in the Far West of the United States. Some further description is warranted by the success of this novel craft and by the fact that others of its kind are under construction for use in the deserts of Asia and Africa, where the sands are known to be gold-bearing. The introduction of this queer ship—which is not a ship at all, but a desert-dredging machine—is regarded by mechanical experts as the beginning of a new era in gold mining. Vast desert tracts in America have been bought, and great areas in China are under survey for the use of this inland ship. Two vessels of this strange type are ready now for shipment to Asia, and their construction and operation are extraordinary. They dig their own canals and their own lakes, and these bodies of water move across the country with the vessels they bear. Over the course they once take the big boats never return. They absorb the treasure as they pass, and they leave not even a ripple of water to mark their progress; instead, in their wake are piled mounds of boulders and bed-rock.

These gold ships are the culminating effort of more than fifty years of ingenious experiment, inspired by promise of bewildering fortune. Take the ancient ark as it is popularly pictured, combine it with a river or estuary dredger, add a large section of a modern battleship, half a score of hoisting-cranes, pile-drivers, steam-hammers and battering-rams, and some conception may be had of what one of these wonderful gold ships is like. A great steel ladder extends in front of the vessel, like an inverted bowsprit. Up and down the ladder march in endless procession bucket-shaped plows with mouths of forged manganese steel. The chain that carries them will support a weight of 500 tons. These keen-edged scoops will cut through solid rock. A marine engine drives them with irresistible force. They delve into the banks ahead of the ship, literally eating up the land. Gorged with rock and sand, the buckets mount the ladder again, and along a huge gantry are carried back to a rotating cylindrical screen, into which they discharge their contents, at the rate of thirteen buckets a minute. Each one of these steel carriers contains five cubic feet of earth, so that an amount of material equal to the contents of three city dump-carts is poured every minute of the day and night into the whirling cylinder.

Five thousand gallons of water a minute are simultaneously forced into the revolving mass. The screens make twenty revolutions every minute. All the principles of mining employed in pans, cradles, long-toms, sluices, grizzlies and amalgam plates are combined in the winnowing process. Tables fitted with eccentric cams, to hold down the coverings of cocoanut matting and expanded metal, catch the gold particles. Riffles containing mercury and amalgam plates are also used, but the cocoanut meshes are depended upon to catch most of the gold. These mats are frequently put through a process of washing in a tank, and a sediment which collects in the bottom is run through a centrifugal amalgamating machine. The amalgam is then heated, the quicksilver expelled and the fine gold remains. All this is done by machinery.

It is estimated that less than one-tenth of 1 per cent. of the gold in the path of the ship escapes. Placer fields which had been worked over five and six times are now being harvested at great profit, so completely do these ships carry off the yellow metal. The ships can even secure paying quantities of gold from the discarded dumps of other mines. Although 300 tons of steel machinery are operated on one of these monster craft, a solitary winchman, aloft in a sort of conning tower, controls the entire mechanism. Levers, brakes and handles, working in quadrants, are all about him. Every part of the complicated vessel is under separate control, and all obey the direction of the winchman with the fidelity and precision of trained soldiers in a regiment. Some of the ships are equipped with enormous steel legs, or spuds, which extend to the bottom of the artificial sea and enable the big boat literally to stride from point to point in its advance.

A remarkable fact is that, in mining with these ships, earth can be handled at a cost not exceeding 3 and 4 cents a ton. The total expense in a day in the operation of one of the great vessels is sometimes less than \$30. The ships cost from \$50,000 to \$95,000, according to size. The first year's cruise will pay for the ship itself, will pay the cost of the land, even at \$5,000 the acre, will meet all expenses, including repairs and depreciation of machinery, and still net the owner over \$100,000. These are figures of actual operations, and regarding land carrying a low proportion of gold. Many are reaping a profit of more than 600 per cent. on their investment. One of the gold ships will devour an acre of earth every month. There are now 100 vessels in the unique Pacific coast fleet.

Private System of Wireless Telegraphy.

ONE of the largest firms engaged in the manufacture of electrical apparatus and supplies in the United States of America has extensive factories in two cities, which are 235 miles apart, and is about to connect them with a wireless telegraph system which it will operate for its private use. The wireless line will be experimental, though an eminent electrician says that it is in every sense practicable and will be of considerable commercial utility to the company. This will do away with the constant stream of telegraphic messages by wire between the two plants and in part with the use of special direct telephone line now in use.

Automobile for Sportsmen.

PERHAPS the most novel of recent designs in American automobiles is one intended for the use of hunting parties. This vehicle, built by a firm in Boston, Mass., U. S. A., will accommodate three persons, and is what might be called a palace automobile. It has a 16-horse-power motor and is built with a strong frame of wood, braced with steel rods, 16 feet long, 4 feet 10 inches wide and 6 feet high. For about 4 feet from the flooring the sides and part of the rear end are sheathed and painted a terra cotta, then varnished. The roof is of waterproof carriage leather, and extends over the entire frame, the hood in front reaching over a foot beyond the front wheels.

Hung from the frame, about three feet below the roof, is a 4 by 6 foot spring bed, with a hair mattress and full equipment of blankets. The seat in front will accommodate three, and the bed may be reached either from front or rear. Just in front of the steering-gear is a curtain, which may be rolled down, and a similar curtain at the rear converts the body of the vehicle into a cozy room, which is lighted by a single incandescent electric light, the power being furnished by storage batteries.

Under the bed is a space 3 feet high, 7 feet long and 4 feet 10 inches wide, in which are stored an aluminum camp outfit, clothing, gasoline and provisions of various kinds. There is also an electric heater, which may be used as a radiator, or to heat soldering-irons, or for cooking purposes in case of emergency.

The machine is equipped with extra tires and two sets of electric batteries. There are also two acetylene headlights, two kerosene headlights and a kerosene rear-end light, all of which may be detached and utilized for illuminating the interior of the car.

The gentlemen for whom this vehicle was built run it night and day, one managing the machine, while the other two sleep, and, according to one of them, "the bed is as easy as that of a Pullman sleeper, except when you strike a rock." As they travel they will select spots for camping when the roads are bad. Meals will be obtained at farmhouses and hotels, or, when desired, can be prepared aboard the automobile. While the weight of the car is a little more than that of the regular body, no difficulty is anticipated in maintaining the speed of the car, if the tires withstand the extra strain.

Battleships Are Machine Shops.

TO some extent it is undoubtedly true, as naval experts declare, that the modern battleship is merely a floating fortress, but it is equally true that such a vessel is a floating power-house and machine-shop. To illustrate: It is worth noting that the contract for the 16,000-ton battleship to be built by the United States calls for the following tools, all of which are to be operated by electric power: One screw cutting back geared extension gap lathe, to swing 28 inches over the upper ways and 48 inches over the lower ways, and to take between centers 10 feet when extended. One 14-inch screw cutting back geared lathe, to take not less than 4 feet between centers. One column shaping machine of about 15 inches stroke and not less than 15 inches traverse. One upright drill press, to drill up to 1½ inches in steel, 14 inches from edge of work, with at least 14 inches traverse of spindle. One 16-inch sensitive drill. One universal milling machine, with at least 18-inch table feed, 4½-inch traverse and 13-inch vertical feed. One combined hand punch and shears, with 6-inch shear blades, to cut ¾-inch round iron, shear ¾-inch steel plate and punch ¾-inch holes in ¾-inch mild steel plates 4 inches from edge. One emery grinder on column, with two carborundum wheels 12 inches in diameter and 2-inch face. One 4 by 30 inch grindstone, with iron trough, on legs. Six bench vises. One blacksmith forge. It is also specified that all necessary and usual spare parts, tools and accessories for the machines mentioned shall be included in the contract.

Trolley Towboat for Canals.

THERE has been built in Toledo, O., U. S. A., a boat for towing on canals which has given such excellent results that it may solve the vexed problem of moving canal boats by power. The boat is built on the catamaran principle, and between the two hulls is submerged a screw propeller, which is 20 feet long and 4 feet in diameter in the center, tapering to a fine point at each end. Motion is given to this by an electric motor carried on the boat, and connected by chain and sprocket wheels, the current being obtained in the usual manner by an overhead conductor and trolley pole. These trolley poles are so designed as to permit of a boat sheering off to one side in passing another.

The screw is revolved at low speed, and, by reason of the pointed ends and peculiar construction, it is claimed that no objectionable back-wash occurs. It apparently screws its way through the water in an entirely different manner from the ordinary propeller, and a slight inward curve given to the after-part of the two hulls throws the current coming between them into an eddy under the stern, no movement of the water being perceptible at the banks of the canal.

Practical Hydrographic Work.—An appropriation of \$1,500 recently voted by the Legislature of the State of New York, U. S. A., will be used in maintaining records of the rise and fall, the ordinary outflow, floods and droughts of many streams in the State. The work has gradually grown until there is hardly a section of the State in which some river is not systematically measured, and at the present time the condition of streams in more than fifty places in the State is regularly reported.

The "New American"

IS THE

Turbine for Export.

Why?

Strength, durability and interchangeable parts reduce repairs to a minimum.

Great power for the diameter.
Economy in use of water.

Vertical or Horizontal Installations
to meet requirements.

Our Catalogue, which will be mailed on request, furnishes detailed description.
We also manufacture Gas and Gasoline Engines, Paper and Pulp Mill Machinery, and a full line of Power Transmission Machinery.

THE DAYTON GLOBE IRON WORKS CO.,

DAYTON, OHIO, U. S. A.

\$600.00 in a day; \$6,000.00 in a month; \$20,000.00 in a season
is the report of an owner of one of our

CARROUSELS OR MERRY-GO-ROUNDS.

Suitable for County Fairs, Parks, Plazas, Pleasure Grounds, or any
Public Place where young or old congregate.

Pays a larger dividend upon the amount invested than does any other known
device made for the pleasure-loving public.

Full particulars, including weight, dimensions and cube, cheerfully given. Prices
quoted f. o. b. steamer at N. Y. City. Our illustrated circulars, English or Spanish, mailed
postpaid to any part of the world.

GILLIE ENGINE AND MACHINE CO.

J. H. RUMBOLD, Proprietor,

TONAWANDA, - - - - - NEW YORK, U. S. A.

Cable Address: "Merrygoround," Tonawanda. Western Union Code.

ESTABLISHED 1866.

PAINTS and VARNISHES OF ALL DESCRIPTIONS

For
Houses, Barns,
Factories,
Fences, Roofs,
Bridges,
Cars, Tanks,
Etc.

White Lead,
Colors,
Marine Paints,
Enamels,
Stains, Dryers,
Asphalts,
Etc.

Strictly Pure Linseed Oil Paints.

Orders Filled through Commission Houses. Illustrated Catalogue No. 25 sent
upon Application.

THE FOREST CITY PAINT AND VARNISH CO.,

CLEVELAND, OHIO, U. S. A.

NEW CUTTER GRINDER

Designed expressly for
sharpening all styles of
Milling Cutters and
Reamers without using
Special Attachments.
No vibration when grind-
ing the heaviest cutters.

WRITE FOR
CIRCULAR.

Good-Road-Making in America.

WHAT is known in the United States of America as the "good-roads movement" is producing enormously valuable results wherever it has been instituted. Its purpose is gradually to establish a vast system of improved public highways throughout the country, thus affording easier means of communication between producers and consumers, facilitating the delivery of mails and affording fine routes for the prompt movement of troops in case of military emergency. In many States this project receives direct State aid, varying from one-third to three-fourths of the whole cost of road construction. Under this arrangement the State of New Jersey has already built about 1,000 miles of road, and the States of New York, Massachusetts, Connecticut and Pennsylvania have each built about 500 miles, while several thousands of miles of additional highways are projected. It is intended in several States that the crushed stone required in building these modern roads should be prepared by the convicts confined in penal institutions. It takes about 2,000 tons of crushed stone to make a mile of good macadam road. If this stone were hauled by the railroads from the penitentiary quarries to the places where it is needed, the average haul would not be more than 100 miles, and the roads could well afford to make a rate of 50 cents per ton, or \$1,000 for freight charges on the stone needed for each mile of road. The rate mentioned would be about half a cent per ton mile. The railroads make much lower rates on wheat and coal and other bulky commodities. Every railroad benefits by the building of good roads in its territory, and there is no doubt that traffic managers would take a liberal view of the proposition and make rates that would barely cover the cost of hauling the stone.

If the State furnishes the stone free of charge, on board cars at the penitentiary quarrying and crushing plants, the counties would get stone by merely paying transportation charges, which would not exceed \$1,000 per mile. The work of road improvement should be carried outward from railroad stations anyway, and the teams that haul the stone out would travel on good roads and their traffic would help to roll the stone into a smooth condition. In a level country the entire cost to the county ought not to exceed \$4,000 per mile, and might be less. An expenditure of \$50,000 per year in an average county would begin to show results in a few years, especially in counties where the traffic centralizes in the county seat. There are enough convicts in every State to furnish the stone, if they were put to work with modern stone-crushing machinery, and it is better to employ them on a rock pile than to have them competing with free labor in industries whose product must be sold on the open market.

The Ten-Hour Clock.

AN interesting labor-saving device in computing time is a ten-hour clock now in successful use in a large manufacturing establishment in Philadelphia, Pa., U. S. A. This clock is different from the ordinary time-piece in this only, that over the usual twelve-hour dial another is fitted with a division into ten hours, and with the year ratio between the hour and minute hands changed from 12 to 10. The clock then read in hours and tenths of hours. When work starts in the morning both hands point straight up to "0." When the whistle blows the clock is started by pulling on a rope. At noon, when the whistle blows, the clock is stopped with the hands pointing at 5 o'clock.

Under the time-keeping system employed the men are instructed to enter on their time-cards the number past which the short hand stands, and to the right of this the number past which the long hand stands. These numbers, side by side, are entered on a time-card when a job is begun, and immediately above them two other numbers are placed when the job is finished. For example, a job is begun at 8.15 A. M. The time entered as shown by the ten-hour clock is 1, 2, and if the job be completed at 3.45 P. M. the time as shown by the clock is 8, 0. The difference between these is 6, 8 or 6 hours and eight-tenths, or 6.8 hours. This time paid for, say, at 27½ cents per hour, gives the simple operation in multiplication $6.8 \times .275 = \$1.87$.

The clock can be used as it stands for any length of hours or length of shifts. It is possible to arrange the starting and stopping mechanism of the clock, so that the act of blowing whistle will start and stop the clock. The use of this device simplifies the time-keeper's work and eliminates much of the liability to error which exists with methods usually employed.

Proposed Army Test of Motor Cycles.

GEN. FRANK D. BALDWIN, a distinguished officer of the United States Army, believes so firmly in the usefulness of motor cycles for military purposes that in order to determine their practicability for use in time of war he has suggested to the War Department the arrangement of a race between such machines from Denver, Col., to Washington, D. C., a distance of nearly 3,000 miles. He says if the department will authorize the expense he will arrange to have two enlisted men make the trip from Fort Logan, Col., to Fort Myer, Va., just across the river from Washington, one of the men to use a motor cycle at Fort Logan, belonging to the Government, and the other man to ride a motor cycle to be furnished by a manufacturer, and claimed to be superior to the one owned by the Government. It is expected that the War Department will authorize General Baldwin to go ahead with the proposed trial, and thus will be demonstrated to the fullest extent the practicability of motor cycles for army use.

Telephones in the Wilderness.

NOWHERE has the use of the telephone proved of larger practical value than in the great lumber camps in the forests of America. Formerly it was necessary to send men on long journeys, 25 or 50 miles through the wilderness, to carry reports or instructions from one camp to another. Nowadays the mill calls each camp in turn at stated hours, and receives reports and gives instructions to the foreman, and it is not necessary to dwell on the commercial advantage of maintaining such close touch between headquarters and outposts in any enterprise. Letters are read to men snowed in the forest 50 or 100 miles away, and answers dictated by the lumbermen to a stenographer who transcribes them at the office and then mails them to their homes. The relative contentment among the men which is established by this frequent communication is highly advantageous to the working force, and, therefore, to their employers. The applications of the telephone to the operations of logging are alike novel and useful. The lines are run upon forest trees along the banks of rivers, and telephones which are contained in sheltering boxes are attached to trees and connected to the line.

One of the worst difficulties of logging is the collecting of the logs together at some narrow place in a turbulent stream, and piling upon each other in a "jam" to which contributions are made by every log floating down the river to this spot. The formation of a jam results from some obstacle, and generally occurs without warning, and it requires great labor, fraught with peril, to remove the logs from their constricted position. It is frequently necessary to use dynamite, and much labor is destroyed by such explosions. With the use of the telephone warning of the initial formation of a jam can be given by one of the men patrolling the banks, who telephones to the men up the river to stop the further flow of logs at calm places, termed "trips," and it is an easy matter to break the small jam, for which further assistance can be had by summoning men from points lower down the stream. As soon as the small jam is removed the men above are told through the telephone to release the logs held at the "trip" and the stream of logs is resumed.

Beyond this the use of the telephone renders log-driving feasible on the smaller, rapid, rough streams, where it was formerly out of the question. Timber dams, with large sluiceways controlled by gates, are built at suitable points, and the men along the river telephone to the men at the sluiceways to open or close the gates as the water may be needed. A prominent lumberman in the State of Washington, U. S. A., was crippled for three years by an accident in the forest, and during this invalidism he directed his lumbering operations from his sick-room by means of telephones connected to his camps and logging-booms, thereby conducting a business of \$250,000 a year under physical conditions which, had it not been for the telephone, would have rendered him, in his helpless disablement, dependent upon other resources, instead of being a man of affairs.

New Method of Preserving Food.

AN ingenious method of preserving food has been devised by an American chemist, which is based on the fact that powdered gelatin, or thin sheets of the same material, not only do not spoil, but are capable of protecting incorporated substances from bacteria, moisture and other agencies which bring about decomposition. Thus, to make a concentrated beef extract, tea or coffee extract, soup, etc., the liquid is mixed hot with 1 per cent. of primary gelatin, which differs from the commercial article in not having the glue-like taste of the latter.

After cooling a jelly is formed, and this is cut into thin films and dried by a current of air until it becomes brittle. When this condition is reached the sheets are then reduced to a fine powder, which will keep indefinitely. While it will absorb moisture it does not do so to a degree to occasion decomposition, and the moisture is subsequently given off in dry air. The powder, while likely to cake, forms a brittle cake, not interfering with its use, while it is too hard for insects. When placed in warm water it dissolves immediately, and is thus ready for use. If heated above the temperature of boiling water before packing all disease or other germs will be killed, and to secure the best results the powder should be packed air-tight. Such a concentrated food possesses many advantages, and is susceptible of wide applications, as upon explorations.

Oil Engine of New Design.

AMERICAN machinists are greatly interested in a new design of oil engine invented by an engineer residing in Chicago, Ill., U. S. A., which embodies a new development of the internal combustion motor and its adaptation to the use of crude oils or oils of a specific gravity that precludes their use in motors of the ordinary type. Like all engines suitable for crude oil the latest innovation has provision for the injection of water into the cylinder before compression. This has the effect of allowing a much higher compression without preignition than is ordinarily possible, and it has other important effects. The builders say that the water vapor prevents the decomposition of the petroleum to a great extent, enabling the engine to run long periods with crude oils without leaving an excess of deposit on the vaporizer's walls.

Alaska's Gold Output.—Shipments of gold from Alaska to the United States closed for the year on September 25th. The output for 1904 is estimated at \$25,000,000.

SMOOTH-ON

TRADE MARK

Smooth-On Iron Cement Rubber Packing is highly metallic, as shown by the cut of Magnet and piece of packing.

This feature insures durability and long life in service—and that makes it economical.

The SMOOTH-ON in the packing has the same expansion and contraction properties as iron; this action makes a tight joint at all temperatures.

Send for catalogue and prices.

SMOOTH-ON MFG. CO.,
VREELAND TOMPKINS, Chemist and Manager,
JERSEY CITY, N. J., U. S. A.

IMPORTERS

In All Parts of the World:

We can offer you the exclusive agency for our "Kee Lox" hard, clean, non-grease carbons in your country, and we call your special attention to the fact that these carbons possess such superior merit that we know they are just what you have been looking for.

These carbons represent a quality so superior to anything that has ever been shown on your market that you will not only be able to compete with, but will be in position to actually take business away from other concerns handling any other carbon on earth.

"Kee Lox" non-grease typewriter ribbons and carbon papers have revolutionized the American market, because they can be handled without soiling the fingers and used without smutting the work during operation. In addition, they possess all the other desirable features of such goods, as we have not sacrificed a single quality to obtain these results.

Furthermore, the "Kee Lox" carbons improve with age, so that the longer they are kept in stock the better they become. Hence, they can be imported in large quantities at one time without risk of loss in deterioration of quality.

Samples and further information, together with our proposition, will be gladly furnished on application to the

Kee Lox Manufacturing Company,

ROCHESTER, N. Y., U. S. A.

THERE MAY BE VAST VALUE UNDER YOUR LAND.

The most valuable minerals are deep in the bowels of the earth.

THE PORTABLE

STAR... DRILLING MACHINE

Is the most strongly built, the simplest and the most economically operated machine in the market...

Any man of average intelligence can run this machine.
No experience is required.

H. A. Richard & Bros., of Marlboro, Ohio, say: "It is a fast driller and the best pipe driver in the market. It is giving us perfect satisfaction."

Duff Bros., of Darlington, Pa., write: "We have been able to drill at a price so low that no other machine could compete with the STAR. Expense for repairs comparatively nothing."

**Star Drilling Machines are made in ten sizes.
Will drill 250 to 2500 feet.**

We also manufacture Drilling and Fishing Tools.

Send for illustrated catalogue.

STAR DRILLING MACHINE CO.
Akron, Ohio, U. S. A.

Cable Address:
"STARDRILL."

Uses "A-B-C Code, 4th Edition,"
or "Universal Code of Lieber."

The Perfect Coffee Classifier.

MONITOR COFFEE SEPARATOR AND GRADER.

This machine removes all foul material and fragments, makes clean separations and grades perfectly in five sizes: Large, medium and small flats, large and small peaberry.

Made in five sizes, and capacities from 6 to 30 bags per hour.

Monitor Rice Separators are used more extensively in the rice industry than any other make of machine.

Monitor Grain, Cereal and Seed Cleaners are unequalled for quantity and superiority of work and low operating expense.

Send to-day for our Illustrated Catalogue of the entire Monitor line, with export prices F. O. B. steamship, New York City.

HUNTLEY MFG. CO., Silver Creek, N. Y., U. S. A.

Success of American Farm Implements.

AMONG all the splendid displays of the products of European energy and skill now on view at the St. Louis Exposition there is not one of farming implements. In fact, there is but one foreign exhibit of that character, and it comes from Canada, where it was produced in a factory controlled by an American corporation. The absence of such exhibits from the European collections at St. Louis is not due to accident or oversight. There is a reason for it, real and convincing. It is due to a general recognition throughout the world of the superiority of American farm implements in design, workmanship, efficiency and cheapness. This standard of excellence is attributable to a combination of tributary conditions. For instance, beyond the United States of America the market for agricultural implements is cut up and divided by a maze of national boundaries, and the farmers of each country are burdened by local prejudices, which the manufacturer must obey in designing his machines. The European manufacturer can, therefore, find only a small market for any one design that he may produce, because each country demands a different design or style of implement. In the United States there are 80,000,000 people whose ideas of agriculture are substantially identical, and the American people are burdened by no prejudices or customs to embarrass the manufacturer.

Another point in favor of American implements is that in the United States there are no irrevocable methods or practices, the dominant idea being to use the most efficient and economical machine that the manufacturer can produce, and a new implement that proves satisfactory in Illinois is also demanded by the farmers of New York and California. This enormous market in the United States enables each manufacturer to turn out a large output of one design at a very great reduction in cost, as compared with a small output. With so great a market, demanding the best that can be produced, the manufacturer is stimulated to do his utmost in making better implements than his competitors. This is a great advantage which the American manufacturer enjoys.

The American manufacturer, with so great a variety of iron and steel to choose from, is able to use for each part the particular kind of material that will give the greatest strength, so that American implements are much stronger than the cumbrous implements that are made in other countries. American manufacturers created the modern implement industry of the world, and the banner of supremacy must remain for many generations to come in the hands of the men who have shown so conclusively their ability to lead in promoting the mechanical economy of agriculture.

Science in Food Preservation.

MODERN economies, as applied to the preservation of food supplies, have probably made their furthest advance in the United States of America. The purpose has been to equalize the supply, health interests requiring uniformity in quality and social needs demanding a broad variety which cannot be maintained throughout the year by natural resources alone. This equalizing of the supply has been brought about by two discoveries, associated with bacteriology; discoveries the beginning of which extends back many years, but whose perfection has only just been reached. The determination of the fact that any food can be kept indefinitely if it can be protected from the action of micro-organisms, and the further demonstration of the efficiency of heat in destroying even the most resisting organisms, has led to the perfection of the process of canning. To-day any food can be preserved indefinitely by canning, and the canning industry has assumed vast proportions. It is not only greatly modifying agricultural problems, by making it possible to preserve for future use otherwise perishable crops, but it is affecting social comfort, by extending the use of many a favorite food from seasons of plenty to seasons of scarcity. At the other extreme has been developed the cold-storage plant, based upon the fact that micro-organisms grow very slowly at low temperatures, and that foods which can be sufficiently cooked may be preserved a long time. This fact again has long been known, but the experiments with the perfected cold-storage plants of modern days have vastly extended the application of cold, until practically all meats and vegetables may thus be preserved. Even perishable fruits that are injured by freezing may be preserved for months in a perfectly fresh condition, and be brought out to rejoice the palate at almost any month in the year.

Utilizing Waste Products.

HOW the so-called waste products are utilized in American industries is strikingly illustrated in the operations of great sawmills. In these establishments nowadays nothing whatever goes to waste. Ten years ago the sawmill owners would pile their sawdust until they had a large heap, and then they would burn it, getting no return whatever. The most of them now have Dutch ovens for drying the dust, and they burn it in their furnaces, making the refuse pay for the operation. Still others have established paper mills and use their sawdust for making paper. In the olden days great logs were taken and squared and the slabs were thrown away. Now a very thin slice is taken off. Then a board is sawed and edged, and in that way hardly a perceptible fraction is lost with the bark, and even the bark has its uses.

American Lumber for Jamaica.—Recent lumber shipments from Savannah, Ga., U. S. A., included 600 tons of orange-crate material consigned to Kingston, Jamaica. The material will make more than 100,000 orange boxes.

Improved Type of Electric Clock.

AFTER experiments extending over many years, American inventors have produced an improved form of electric clock which, it is predicted, will displace the old system of weights and springs for operating the mechanism of timepieces. The simplicity of this clock immediately recommends itself to all, and jewelers and clock manufacturers anticipate better results from this kind of timepiece than from any of the old-fashioned ones. By means of an electro-magnet and a pivoted armature, to which a pawl is attached, that moves in the ratchet-wheel, the ordinary springs and train of wheels are dispensed with. With the swing of the pendulum the circuit of the electro-magnet and a battery is opened and closed. One good dry-cell battery will operate the clock for months, and when the current is exhausted the cost of renewing is merely nominal. The electric clock thus does away with intricate machinery and the trouble of winding it every few days. The construction is so simple that any one familiar with the element of electricity can repair it. As the repairs of clocks and watches constitute a good part of the trade of the retail jewelers, the electric clock is not apt to prove so popular among them as the weight and spring clock.

The ease with which any number of these electric clocks may be operated in synchronism is an advantage of no small moment. In factories, mills and large manufacturing plants, where it is essential to have the exact time in all the rooms, the electric clock will prove of peculiar value. By removing the pendulums from all but one clock, with the others connected in circuit, the exact time can be kept with all the clocks in the plant. Furthermore, the regulation of timepieces by electric power from some central station is thus greatly simplified. With a wire running to the main clock of the plant an exact regulation of all in the series could be instantly obtained.

Electric clocks for watchmen have also been devised, so that it is impossible for the operator to change the register, or in any way make the clock show the wrong time when touched. The electric apparatus is carefully locked inside the case, and when the watchman puts the key in to register the time of his patrol it is impossible for him to manipulate the work in any way to suit his plans.

Crude Oil to Lay the Dust.

CRUDE petroleum is now successfully used to lay the dust on the tracks of the railway which crosses the great Mohave Desert, in the State of California, U. S. A., and the discomfort hitherto attending that journey has been removed. Formerly the desert dust was so penetrating that it entered through the double windows of sleeping-cars, even though the windows were tightly closed, stifling the traveler and ruining his clothing. There was no escape from it. If a passenger retreated from the stifling air of the car to the rear platform he was blinded, not only by the flying sand, but also by the showers of hot cinders belched out by the locomotive. Driven back into the car, the passenger prayed, half sick, for the quick transit of the desert. But the blistering, shifting Mohave has lost its greatest terror. Only the heat remains, but this is uncomfortable only in the summer months, and may be avoided even then by a night ride across the plain. The company has bathed its roadbed all the way across the desert with crude oil. The California oil has an asphaltum base, and it has soaked in and bound the sand together in a compact mass, so that not a particle of dust can be raised, no matter how swiftly a train is traveling. The storms of the desert sweep the sand on to the right of way, but the smooth-oiled surface affords it no resting-place and it passes on. Oil instead of coal is also burned in the locomotives, doing away with cinders, and car windows are now left open all the way across the Mohave Desert and in other places where dust and cinders formerly assailed the passengers.

New Three-Wheeled Plow.

ONE of the most valuable of the new farming implements recently introduced in the United States of America is an improved type of three-wheeled riding plow, the improvement consisting of what is called the "high-spring lift." This idea has been generally adopted by all the plow manufacturers, and it makes a plow far superior to the three-wheel plows heretofore in use. The plow beam is supported on two cranks or bails, on which the plow is raised and lowered in the field. The support on two cranks keeps the bottom of the plow level, and the heavy supporting springs balance the weight of the plow, so that a child can raise it out of the furrow. While the high-spring lift has merely made it easier to operate a single plow, and has made the plow work a little better in the furrow, this improved construction has been found indispensable in making gang plows. The two bottoms of a gang plow are too heavy for a man to handle them conveniently by a lever, but the spring lift has made gang plows very popular among American farmers. One man, with four horses and a gang plow, has no difficulty in plowing five or six acres per day, and the plows do faultless work.

Automatic Hydrant.—Recent American inventions include an automatic hydrant for use in parks and other public places. Instead of attaching the metal dippers by chains to the hydrant posts, this device provides that the chain shall be attached to a handle. The weight of the dipper depresses the handle and keeps the water from flowing. When a drink is desired, the act of picking up the dipper releases the spring actuating the cut-off valve and water runs without further turning on.

The Silver Manufacturing Co.

373 Broadway, Salem, Ohio, U. S. A.

MANUFACTURERS OF

"Dole" and "Silver" Hub Boxing Machines.
 "Star" Hollow Angers, "Dole and Deming."
 Spoke Tenon Machines, "Silver's" Band Saws.
 Portable Forges, "Silver's" and "Advance."
 Blacksmiths' Drills, Hand or Power.
 19-inch Post Drills and 20-inch Base Drills, Tuyere Irons, etc.
 Wagner Sausage Stuffers.
 Plain Screw Lard Presses.
 Ham Preserving Pumps.
 "Ohio" Hand and Power Feed Cutters.
 "Ohio" Self-Feed Ensilage Cutters and Blower Elevators.
 Metal Bucket Chain Elevators and Root Cutters.

 CORRESPONDENCE SOLICITED.

Order through any buying and shipping agent in New York or
elsewhere.

Varied Uses of Asbestos.

RECENT disasters in America and other countries, involving dreadful losses of life by fire, have greatly increased popular interest in the United States in asbestos as a fireproof substance. The uses of asbestos, apart from its value as an immediate protection against flame, are varied and constantly increasing. Asbestos cloth is used for purifying water, for filtering acids and for other domestic purposes, and also in sugar refineries, in smelting works and in glass and iron works as a protection against fire and heat from molten metals. In laundries and print works this cloth is used for covering steam rollers, etc. Aprons, mittens, gloves and other articles of wearing apparel are beginning to be made in some considerable quantity from this mineral, as are also ropes of various sizes.

Other uses of asbestos are in the manufacture of felt and cloth for covering dining-tables to prevent the hot dishes from injuring polished surfaces, for stove mats, for iron-holders, iron-rests, etc. Asbestos yarn is also now manufactured which can be crocheted and knitted into fireproof lacework as fancy hangings for lamps, etc. Various sizes of cord, twine and string made from asbestos fiber are adapted for all kinds of work of suspending metals, retorts and crucibles in contact with fire, and for sewing asbestos cloth and binding materials that are exposed to the action of fire or acid. In the glass-worker's industry asbestos is used in the manufacture of shovels, baker's screens, disks, bottoms, etc. The sheets of asbestos are hardened and stiffened and are durable under very intense heat. Various shapes of soldering blocks are made from asbestos, which are especially designed for jewelers, silver-smiths, dentists and others who use the blowpipe for soldering, melting, or in similar fine work. Still other uses of asbestos are in the manufacture of fire-proof paints and as packing in the manufacture of fireproof safes.

Steel-Making Capacity of the United States.

ACCORDING to statistics compiled by experts of established reputation, the steel works of the United States have a yearly productive capacity of 13,551,000 tons of Bessemer and 11,335,100 of open-hearth steel—a total of 24,886,100 tons. It appears that the United States Steel Corporation controls 59 per cent. of the Bessemer steel-making capacity, but only 26.4 per cent. of the open-hearth furnaces. While the total increase in yearly capacity for producing Bessemer steel has been 613,000 tons, or 4.7 per cent., in three years, that of the Steel Corporation has been—by construction and purchase—373,000 tons, or 4.8 per cent.—that is, about even with the total gain. On the other hand, the total increase in open-hearth furnace capacity has been, in three years, 3,045,350 tons, or 36.7 per cent.; the Corporation's increase—chiefly by purchase—was 778,500 tons, or 27.2 per cent., being considerably below the general gain—that is, the Steel Corporation controls now a smaller proportion of the open-hearth steel output than it did when it was first organized, and about the same proportion of the Bessemer production as at that time.

Sulphur for Export.

ANOTHER line of American exports has been opened by the recent shipment of several large cargoes of sulphur from the State of Louisiana, U. S. A., to Europe. These shipments are particularly interesting, in view of the fact that the United States uses more sulphur than any other country in the world, consuming from 150,000 to 175,000 tons a year, a considerable portion of which has been imported from foreign sources. The development of the Louisiana deposits, however, seems likely to supply domestic requirements and leave large quantities available for use in Europe, where the markets are at present dependent upon the rich deposits in Italy. The quality of the Louisiana sulphur is good, frequently analyzing 99.5 per cent. sulphur, it being practically refined in the course of extraction by the steam process. The primary cost is small, so that with an increasing output Louisiana will occupy a unique position in competition with Italian producers.

Dynamite in Farming Operations.

IN the western region of the United States dynamite is extensively used by farmers to break up the "hard pan" stratum just underneath the surface, below which there is good soil and ample moisture. In the sagebrush and alkali regions this stratum of "hard pan" will not let the moisture come to the surface, nor can tree roots and alfalfa roots reach the moisture. So the surface is dry alkali, the mother of sagebrush and nothing else. The dynamiters believe that by smashing this barren and rebellious stratum they can make the moisture come up and the roots go down. Crops have been planted over a considerable tract of dynamited ground. In the fall we shall know how good a farmer dynamite is.

Hose Coupling to Fit Any Hydrant.

WHEN fire companies were summoned from other cities to assist in fighting the great fire in Baltimore, Md., U. S. A., in February, 1904, many of them found on arrival that they could render no service, for the reason that their hose couplings could not be connected with the local hydrants, being of a different size. To provide for such emergencies a new device has been invented, which permits of hose connection to any hydrant, larger or smaller. This makes connections of all cities and towns interchangeable, and an absolutely tight joint can be secured in from two to seven seconds.

English the Language of Commerce.

UNDER the changing conditions of international intercourse English is now the dominant language in the commerce of the world. One indication of its growing importance is the recent action of the school authorities of the German Government in making English an optional study in the public schools of Saxony. This action was induced by a petition addressed to the Government by the Dresden Schoolmasters' Association. The petition was an excellent syllabus of the arguments in favor of English as a subject for study in the German public schools.

It is only within recent times that English has been taught carefully even in English and American schools. The old theory was that a student learned English best by reading the Latin and Greek authors. While the benefits of a knowledge of Latin and Greek are very great and certainly assist in acquiring the accomplishment of using English correctly and elegantly, the close attention now given to English in our own schools will improve the average quality of English composition.

We scarcely appreciate what a treasure we possess in our English tongue. The vocabulary of English has been enriched by plunder from every land and every language. It is a flexible tongue, adaptable to any idea, and a tongue which welcomes accessions when those are necessary. It is not by its intrinsic virtue, however, that the English language is spreading and is becoming the cosmopolitan medium of communication, but rather by the increasing importance of the people who speak English. The British and the Americans control a large portion of the world's trade. Their influence is felt everywhere. They sell to everybody and everybody wishes to sell to them. Verily, the English language has come forward since the time when Bacon, despairing of the perpetuity of the English tongue, translated some of his works into Latin.

Foremost in Furniture Making.

IT is claimed on behalf of Grand Rapids, Mich., U. S. A., that more furniture is made there than in any other city in the world. The city enjoys the advantage of cheap and abundant water-power, close proximity to vast supplies of valuable woods used in the manufacture of furniture and ample means, both by rail and water, of reaching the markets. There are ten particularly large furniture plants in the place, but altogether the town boasts of sixty-five factories devoted to furniture, which easily makes it the greatest center of production in this line of goods on earth. The fame of Grand Rapids has spread throughout every part of the habitable globe, and buyers from every land go there twice each year to make selections. Three generations of skilled furniture workmen have been reared in Grand Rapids, and to to-day the city can justly lay claim to producing as splendid specimens of cabinet goods as are made anywhere.

Good Fuel Free of Cost.

IN the great shoe manufacturing city of Lynn, Mass., U. S. A., enormous quantities of fuel wood are given away every season. The shoe manufacturers, in order to keep their product fashionable and correct, change their lasts every season. Thus, as soon as a season is over, thousands of lasts become worthless except for burning. The manufacturers might sell the lasts, but for some reason or other they don't do this. They give them away, and the Lynn people appreciate this generosity. At any rate, it is possible in their beautiful town to see a Lynn man with a grateful look on his face taking home a load of lasts in a cart. The lasts make admirable fires. The good, hard wood in them gets red hot and burns with a great glow of heat for a long time, like coal. The only trouble is their shape. They look, you know, like feet. To see them flaming in a fireplace gives a stranger a shock at first.

American Traction Trucks Abroad.

RECENT orders to a Philadelphia manufacturing company call for twelve single trucks, traction type, for earliest possible shipment to Barcelona, Spain. Another order was for ten traction vehicles of maximum power for Tokio, Japan. These last mentioned vehicles are to be of identical build with a large number recently shipped by the same firm to Dunedin, New Zealand.

American Cars for London Underground.

THE American Car and Foundry Company has received the first order ever placed with foreign builders for cars for the London Underground Railway. The contract calls for 100 passenger cars of steel, with an understanding that if the cars are satisfactory the builders will receive contracts for 1,000 cars additional. German car manufacturers were active competitors for the contract.

Picking Cotton by Moonlight.—In order to save the fast ripening crop in the State of Georgia, U. S. A., the planters have put laborers to work picking cotton by moonlight. These scenes of activity in the cotton fields at night were necessitated by the scarcity of labor from which the South is suffering. The pickers are worked day and night, taking a rest during the hottest part of the day. A prominent planter has declared after a visit through the cotton States that the labor problem will cause much cotton to go to waste in the fields.

Knock-Down Office and Home Furniture for Export. The "GUNN" K. D. Sectional Bookcases.

Top Section
List, \$3.00

9 1/4" Section
List, \$4.15

11 1/4" Section
List, \$4.50

13 1/4" Section
List, \$5.25

Base Section
List, \$2.65

THREE-SECTION CASE.

With top and base set up. Weighs 135 lbs. gross, 100 lbs. net, and of 6 1/4 cubic feet. This cut represents the entire line of sizes, and will make a case for 10 books or 10,000 books, growing as the books accumulate. Measurements are inside. All sections 10 1/4 inches deep and 32 1/4 inches long. Made of selected quarter-sawed oak and handsome polish finish.

THREE-SECTION CASE, as shown, complete - - - each \$10.76
SIX-SECTION CASE, as shown, complete - - - each \$17.98

IMPORTANT NOTICE.—To secure full benefit of above, even sample orders should not be for less than the steamship minimum for issuing ocean bills of lading. Some steamship companies accept not less than 40 cubic feet, while others not less than 80 cubic feet. Six Three-section Cases occupy 40 cubic feet; Four Six-section Cases occupy 40 cubic feet. NOTE explanation of ocean freight on "Gunn" K. D. Cases: "An ocean rate of 10 shillings per 40 cubic feet equals a cost of eight cents per section, or about four per cent. on the cost boxed f. o. b. New York."

Specify "Gunn" when ordering. Orders received direct or through export houses. When ordering through the latter, to avoid errors, please mail us duplicate of order. Our catalogue, illustrating and describing the various styles of Sectional Bookcases and Filing Cabinets made by us, mailed postpaid.

THE GUNN FURNITURE CO., Grand Rapids, U. S. A.

Western Union and A. B. C. Codes used.

Cable Address: "GUNN," Grand Rapids.

We also make a full line of Roll and Flat Top Office Desks and Typewriter Cabinets.

A FEW REASONS WHY THE "GUNN" K. D. SECTIONAL BOOKCASES ADMIT OF DIRECT IMPORTATION TO THE TRADE.

The assortment is SMALL. All parts are INTERCHANGEABLE, making every possible size bookcase from the same stock. They require but little space in warerooms, as the cases are shipped K. D. (flat) and can be set up as required, with no tools but the hands.

Our method of boxing K. D. (flat) insures arrival of goods in PERFECT CONDITION, as NO POSSIBLE DAMAGE CAN OCCUR TO FINISH AND NONE OF THE PARTS CAN SWELL OR WARP, as in ordinary furniture. Deliveries can be made in thirty days, and by using our special code, twenty days.

ADVANTAGES OF THE LINE.

The field to sell is very large, as the same stock meets the demand from offices and public buildings, as well as for home use—in fact, anywhere an article is desired to be covered from dust and moisture. Each sale made is a guarantee of repeated purchases for additional sections, as books accumulate. The sections can be added, vertically or horizontally, to fit the wall and space. The glass doors, when raised, disappear, sliding on small frictionless roller bearings. The "GUNN" is the only case in which a broken glass can be replaced by simply taking off the door, and without removing the books or taking the case apart. The cases, when set up, present a handsome appearance, with no objectionable features, and are as rigid as an ordinary bookcase.

We GUARANTEE the "GUNN" SECTIONAL BOOKCASES PERFECT IN ALL RESPECTS.

Special Offer for Export Only:

The prices here quoted (U. S. gold or its equivalent) include boxing for steamer, and delivered f. o. b. cars at New York City.

"Gunn" K. D. Sectional Bookcase.

This cut shows our knock-down (flat) construction. It is put together without nails or screws, or dowel-pins; the irons that are fastened to the shelves have upper and lower tongues that fit in the grooves in the bases, center sections and top sections, thereby binding all rigidly together.

Americans Eating Less Meat.

VITAL statistics compiled by life-insurance experts indicate that the American people are curtailing their use of meats and taking more to a vegetarian diet. In the matter of mutton, for instance, every 100 Americans in 1850 consumed 94 sheep, nearly a sheep to each man, woman and child; in 1900 the consumption had been reduced to 50 sheep to every 100 persons, a reduction of almost half. More remarkable still has been our turning from pork, 118 hogs to every 100 persons in 1850—more than one hog for each man, woman and child—to 43 hogs in 1900. We are still large eaters of beef, however, though here, too, there is a reduction of 20 per cent., from 25 beeves to 100 persons in 1850 to 20 beeves in 1900.

But what of milk, butter, cheese, eggs and poultry, which must be considered as meat foods in contradistinction to those which are strictly vegetarian? Here, too, though the statistics do not cover the whole period of fifty years, we find interesting changes, mostly large increases. For example, in 1880 the supply of eggs was 920 dozen for each 100 persons, and in 1900 it reached 1,700 dozen. In the same period the supply of dairy products increased threefold. The only dairy product showing a decrease is cheese. Fifty years ago each person ate $4\frac{1}{2}$ pounds annually. In 1900 the amount had dropped to one-half pound.

Reducing all these various meat products to a common denomination—dollars and cents—we find that our meat diet as a nation has decreased in fifty years by about 36 per cent.

Science in Building.

IN the construction of tall buildings in the United States of America, known as "sky-scrapers," there is an application of scientific principles of which the general public knows little or nothing. People who sit secure and indifferent in the offices 200 or 300 feet above the pavement and hear the wind howl and hurl its blasts about the steel cage that encloses them think little of the mathematics on which their safety is based; but if that mathematics were not the surest product of the human mind they might find themselves at the bottom of a tangled wreck. Their safety depends primarily upon what is called "wind-bracing." This is a system of steel connections which, in the body of a tall building, serve a purpose similar to that of the interlacing muscles and tendons which bind together the bones of the human skeleton and enable it to act all together, as a unit, in resisting forces tending to upset or crush it. In a scientifically constructed building the force of the wind pushing against its upper portion arouses a resistance which is transmitted downward from story to story, and is distributed on all sides from member to member of the steel skeleton, until it is felt at the foundations, and thus the strength and weight of the lower portion of the building, lying in the shelter of the surrounding edifices, out of the reach of the wind above, are brought into play for the common defense, very much as the effects of a push against a man's shoulder are distributed throughout his muscular system, down to his feet, and are thus resisted by his whole body.

Developing Seedless Fruit.

HAVING successfully propagated seedless oranges and made decided headway toward the production of seedless lemons, American growers are engaged in efforts to introduce seedless fruits of many other species. The seedless tomato is already an accomplished fact, and the quality is excellent. In general, it appears that where the strength of the plant has not to go to the growing of seed the fruit is of superior quality. The seedless apple has also arrived. It has at the end opposite the stem a slight hard formation somewhat like that in a navel orange, but no seeds. Oddly enough, or perhaps it might have been expected, the seedless apple-tree does not have petalled blossoms. The apples grow out from little buds like the calyx of a flower.

Promising and partially successful efforts have also been made to propagate seedless plums and seedless grapes. The seedless watermelon appears to be a certainty of the near future. As far as they have progressed, the melon experimenters have obtained a fruit containing only a few seeds. It seems only a question of time when we shall buy in the markets all these fruits in a seedless state.

Novel Heating Arrangement.—The gas companies in the city of Baltimore, Md., U. S. A., are installing a novel arrangement for heating kitchens and furnishing hot water during the winter months. Heat for this purpose is derived from the ordinary house furnace. The object is to make it unnecessary to use the range in the kitchen during the winter. An appliance is placed in the firebox of the furnace to heat water, and this water is carried to a radiator in the kitchen for heating purposes, and to the hot-water boiler for consumption. It is estimated that the amount of additional coal consumed in the furnace is fractionally small, and the plan puts out of commission the kitchen range, which is superseded for cooking purposes by the gas range.

New Thing in Bottle Designs.—A new type of bottle is one that provides a permanent slide on top of the bottle, in which is a permanent and not removable cork. When the bottle is inverted, the cork slides downward past some small holes, through which the liquid contents of the bottle can run out. When the bottle is returned to an upright position, the cork seats itself by gravity. The device is intended for drug-store bottles, medicine bottles, whisky bottles in bars and other bottles in common use.

Electric Power on Railroads.

THAT electricity will ultimately displace steam for use as motive power on American railways is indicated by the policy recently instituted by one of the great carrying companies from whose central station in the city of New York nearly five hundred trains are despatched every twenty-four hours. The steam locomotives required to haul this enormous traffic will soon give way to electric motors of 2,200 horse-power each. These electric locomotives will have a speed rate of 75 to 80 miles an hour when attached to a heavy express train. They reach the top notch of electric locomotive construction in the world thus far, in their combination of power and speed. They have more than twice the drawing strength and four times the speed capacity of the locomotives that handle the Baltimore and Ohio's 100-train daily traffic in the city of Baltimore. Upon the successful operation of these colossal locomotives will depend to some extent the rapidity with which electricity advances in its contest with steam for the supremacy of the railroad traffic in this country.

On June 30, 1900, according to the United States census, there were 1,262 miles of electric railroads in operation in the United States. Two years later this mileage had increased more than 1,600 per cent., or to 21,920 miles of electric trackage. This has now advanced to more than 32,000 miles—it was 29,212 on the first day of the present year. This is all exclusively of lines in operation, while several thousand miles are building or are definitely projected.

Novelties in American Shoes.

INCLUDED in the very latest of American designs of fine shoes for women are several of exceptionally attractive character. The Blucher in Oxford, double soles and extension edges, wide or narrow toe, is put forward by the foremost dealers as a leading winter shoe, and the same style is to be had in the high-cut lace shoe. It is made in either enamel or box calf. The dress boot in patent leather will be of pointed toe, and the appearance of a blunt toe, unless there is a certificate of gout with it, with a dress suit, will be the cause of adverse criticism. Button boots, as heretofore, will be the only correct form for afternoon dress (they may be either of patent leather or calf), while the patent-leather pump will hold sway in the evening at strictly full-dress functions. The tan grain leather boot has no equal for storm wear, and will again be in vogue on wet days. Enamel leather seems destined to incase many feet this season, while heavy vici kid will hold its old admirers. It may be only temporarily, but for the present, at least, patent-leather shoes have been relegated to the boot-tree and wardrobe, in so far as every-day street wear is concerned.

Popular Regard for Trademarks.

AN American magazine writer of distinction, after a careful study of the whole question, contends that the purchasing public has a powerful sentimental attachment for distinctive and well-advertised trademarks. Many of these, he says, have been advertised for years, and the proprietors of them are ready to expend large sums of money and invoke the aid of an intricate system of patent law to control the so-called "good-will" of the trademark. So evident has the value of the trademark become that an advertising agent of importance has recently sent out an appeal to manufacturers to adopt one—as distinctive of their product. Of what does this good-will consist? Again we seem compelled to refer to the book of human nature. It is not because these trademarks are in themselves attractive or beautiful, or that they represent with unusual fidelity the article advertised; it is rather because the buying public has long been accustomed to this particular figure, or design, and through long years of association with it at home and abroad has grown to have a real affection for it.

Alaska as an Investment.

WHEN the United States Government in 1867 paid Russia \$7,200,000 for the territory of Alaska many leading Americans seriously contended that the Russians had decidedly the better of the bargain. The short-sightedness of that view is clearly shown by a few official facts. In 1867 Alaska imported nothing from and exported nothing to the United States. In 1903 it bought from the people of the United States \$9,266,504 worth of all kinds of merchandise and sent \$21,167,787 worth of gold, copper, tin, silver, fish, furs, fertilizers, wool and numerous other products of the country. In other words, in one year alone it paid back nearly \$2,000,000 more than the Government paid for the territory in 1867, and added to the actual wealth of the United States during the same period, approximately, three times the amount of the original purchase price.

Interesting Telephone Figures.

MORE than 600,000 additional telephones were installed in the United States of America last year by the leading company, bringing the total number used by its subscribers up to above 3,375,000—that is, one telephone for every twenty-four persons in the United States. These telephones are served by nearly 4,000,000 lines of wire—enough to make a 16-wire cable to the moon. The daily average of messages was last year upward of 10,000,000, the total number of messages for the year being therefore in excess of 3,650,000,000, or about 45 per head of the entire population of the nation.

Taking Wireless Messages on Tape.

STEPHEN DUDLEY FIELD, a nephew of the inventor of the Atlantic cable, has devised a system whereby messages transmitted by wireless telegraphy can be recorded in the Morse alphabet on paper tape. The instrument by which this is done is called an amplifier. It is an electrically delicate machine of wire coils and magnets so adjusted as to record all variations in the electric current which passes through it. It occupies less than a half cubic foot of space, and one of its most novel features is the use of threads of glass one-one-thousandth of an inch in diameter to truss and connect some of the smaller parts. In the demonstration the usual telephone receiver was cut out from the electrolytic responder which received the wireless message. The current was turned into the amplifier instead and the message was clicked out in printed Morse characters on the tape. The amplifier, Mr. Field explained, was but a mechanical microscope for electricity.

The inventor declares that all the attachments, such as photograph reproducers and the like, now in use for wire telephone and telegraph lines, may be made by the amplifier available for any wireless or ocean cable system. By means of it a land line may be joined directly to a wireless one, and by this means a message might be sent through ether waves from London across the ocean to New York, and there turned into a wire and carried without interruption to San Francisco.

The same amplifier applied to ocean cables, it is asserted, will more than double the present speed of transmission and will allow the connection of cables and wireless or land lines direct, so that a message may be sent around the world by one operator without its being repeated from station to station. It is to ocean cables and wireless telegraph lines what Edison's carbon button was to Bell's telephone.

School for Judges of Livestock.

AN illustration of the careful methods with which the animal industries of the United States of America are conducted appears in the two weeks' course in stock-judging which has been established at the Agricultural College of the State of Iowa. This course is intended for the farmer and his son and all who are interested in the breeding, feeding and management of improved cattle, sheep and swine. Three days will be devoted to each class of stock. There will be two classes—one for beginners, in which will be studied the different market classes and grades, and another for those who have attended a previous course, in which will be taken up the characteristics of the pure breeds of domestic animals. In connection with this work, there will be a block demonstration, in which animals of different types will be judged on foot, slaughtered and then cut up to show the different market cuts and their value to the producer and the consumer. The classes in this course will alternate with those in corn and grain judging, so that all students may take all the work in both courses.

Telephone Aid for the Deaf.

RECENT experiments have shown that a modification of the telephone can be made highly useful to persons afflicted with deafness, and several forms of instruments designed for that purpose have already been produced. There has lately been patented in the United States of America an installation of this character which can be stowed away in any ordinary derby hat, the only portion of the apparatus exposed to view being two ear-tubes, which depend from the sides of the hat and repose in the ears. The sound-collecting bells are adroitly concealed in the sides of the hat crown.

Oil Fuel in Locomotives.

CONFIDENCE in the value of liquid fuel for locomotives is conclusively shown in the fact that one of the great railway companies in the United States of America is preparing to substitute oil for coal in 780 locomotive engines on a system comprising upward of 9,000 miles of road. This company operates lines extending as far as from the English Channel to the Golden Horn and back again, and the cost per horse-power with oil is only a third of the cost of coal.

Large Shipment of Plows.

ONE of the largest single shipments of American plows to foreign markets of which there is any record was started recently from a manufacturing plant in the State of Iowa. The lot numbered 1,000 sulky plows, fifty gang plows and a large number of corn-planters. Thirty-seven railway cars were required to carry the consignment to tidewater.

Strange Indifference.—The chief factory inspector of the State of Indiana says that in enforcing the laws relating to safety devices in shops one of the chief troubles is to get the employees to use them and treat them fairly. They are often ignored or discarded by the men, who seem often to see in them only reflections on a workman's ability to take care of himself.

American Coal Production.—The total coal output of the United States up to December 31, 1902, is estimated at 4,860,000,000 short tons. That means that a pyramid built of this material as high as Pike's Peak (14,108 feet) would have for its base a rectangle 1.14 miles square. If the coal were spread out over the States of Rhode Island and Connecticut it would cover both of them a foot deep.

Increased Demand for Wood Alcohol.

SHOULD the alcohol motor, now undergoing various tests in the United States of America, prove of commercial value as a power-producer, a largely increased demand for wood alcohol is morally certain to follow. To supply that demand and at the same time provide the large supply annually required by foreign buyers would necessarily involve an enlargement of alcohol production in the United States. It is pointed out, however, that this increased supply can be provided without any detriment to timber or lumber interests. The supply of wild woodlands suitable for charcoal-making, and incidentally, for alcohol distilling, is almost unlimited, and there is a possibility of industrial development in this direction that can scarcely be measured to-day. The annual fires in American forests consume wood enough to produce many millions of gallons of alcohol, and this enormous waste is only part of the loss. The lumber mills, in spite of their efforts to utilize all parts of the trees, waste millions of feet of wood that would furnish the charcoal-burner with excellent material for his work. By extending the charcoal and wood alcohol industry to new districts, the wealth derived from forests would multiply rapidly, and incidentally the cost of wood alcohol might be reduced to a point where it would prove a most efficient and economical fuel for the alcohol motors of the near future.

America's Great Fruit Industry.

THE greatness of the fruit-growing interest in the United States of America is indicated by the fact that the output of fruit of all kinds in 1903 amounted to \$132,000,000. The yield for 1904 will be worth considerably more. The orchard fruits have an annual average value of \$84,000,000; small fruits, \$25,000,000; grapes, \$14,000,000, and citrus fruits grown principally in California and Florida, \$8,549,000. The seven great fruit-growing States in the order of production are California, New York, Pennsylvania, Ohio, Michigan, Illinois and Indiana. Michigan has more peach trees than any other State. New York leads all other States in apples. Illinois is second, with an annual product of 9,200,000 bushels, Michigan coming next with 8,951,000 bushels and Indiana third, with 8,620,000 bushels. The apple crop of the country, which in 1900 was 175,397,000 bushels, has increased with the extension of orchards in the West. The apple crop for 1904 is one of the largest on record.

Gasoline Vehicles in Favor.

HOW promptly American manufacturers respond to the requirements of foreign buyers is admirably illustrated in the item of touring cars. In several recent years the American steam runabout enjoyed great favor—and justly, so far as can be learned—but there is now a demand for the gasoline runabout, which American builders are ready to supply. Aside from the change in motive power, these new light vehicles of American build have beautiful, graceful bodies and running gear unsurpassed in the world. The favor with which they have been received abroad is evidenced by the fact that 1,600 vehicles of the character went to foreign buyers last year.

Railway Passenger Traffic.

IT is officially stated that the railroads of the United States of America carried more than 695,000,000 passengers during the fiscal year ended June 30, 1904. These figures represent an increase of 45,000,000 passengers, as compared with the preceding year, showing in this way an average number of more than eight journeys a year for each of the 80,000,000 inhabitants of the country. Each one of these 695,000,000 passengers, as a living human being, had to be considered individually, and so each represented some part of the work of the passenger agent and ticket man.

Gifts to American Libraries.

GIFTS to American libraries during the year ended May 31, 1904, amounted to \$6,103,137 and 137,318 volumes. Of the money Andrew Carnegie alone gave \$1,507,600. Among the other gifts there were fourteen under \$10,000, fifteen of \$10,000, sixteen between \$10,000 and \$15,000, six between \$15,000 and \$20,000, five of \$25,000, three of \$30,000, one of \$40,000 and four of \$50,000 or more.

Utilizing the Sun's Rays.—At Los Angeles, Cal., U. S. A., interesting experiments have been made in using the heat of the sun to create power and to heat water for domestic purposes. At an ostrich farm near the city a solar motor is in operation every sunny day, or about three hundred in a year, and pumps 1,400 gallons in a minute. Solar heaters are placed on the roofs of houses and connected with water pipes. One heater will supply water for domestic purposes for an ordinary family.

Women as Land Agents.—Two enterprising young women have been engaged by one of the largest railway companies in the western part of the United States as agents for the sale of its lands. They have the distinction of being the only women in the world retained by a railroad land department. They not only sell the land, but they show it. They have for sale more than 50,000,000 acres—quite enough to keep them busy and out of mischief.

AWARDED GOLD MEDAL at WORLD'S FAIR, ST. LOUIS, for BALL-BEARING WASHING MACHINES

COST: Two "1900" and Two "1900" JUNIOR WASHERS—Four Washers, at \$6.62½=\$26.50.

SELLING PRICE: Two "1900" and Two "1900" JUNIOR WASHERS—Four Washers, at \$14.00=\$56.00.

Net Profit Over 100 Per Cent.

FOREIGN MARKETS ONLY. Upon receipt of \$26 50 in U. S. Gold, or its equivalent, we will pack, ready for transportation abroad, and deliver f. o. b. New York, Boston, Philadelphia or Baltimore,

Two "1900" and Two "1900" Junior Ball-Bearing Washing Machines.

Weight of the above four Washing Machines, 250 pounds.

The "1900" Ball-Bearing Washing Machines are the embodiment of the results obtained from over twenty-two years' practical experience in the making of washing machines, and, unlike any other washer upon the market, **do not tear and wear the garment**, but by the adoption of our **agitator** tosses and tumbles the garment through a **whirlpool of water**, thus **forcing the water through the finest or coarsest fabrics**, causing the clothes to become **absolutely clean, without boiling or scrubbing, without wear or tear, and without the use of chemicals.**

Send us \$26.50 for two "1900" and two "1900" Junior Washers TO-DAY. We will ship the washers same day that we receive your order. In acknowledging receipt of your order we will quote your price of washers in car-load lots. You will quickly convert your sample order of four washers into cash, with a profit of over 100 per cent.

THEN YOU WILL ORDER IN CAR-LOAD LOTS. Orders received direct or through export commission houses. When ordering through the latter, please specify "1900" and send us duplicate of order.

The "1900" Washer Company,
BINCHAMTON, NEW YORK, U. S. A.

AMERICAN TIME STAMP.

Marks Time by the Quarter Hour with Ease and Positive Movement. No Clock Work to Get Out of Order. Costs One-Tenth the Amount of a Good Clock Stamp and Does Better Work.

This stamp is used as an ordinary Rubber Hand Stamp. The printing die is mounted on a flexible rubber cushion attached to an aluminum base, making it light, yet strong. To use, simply turn the handle until the desired time is seen on top dial.

Price, with dates and printing die, as illustrated, **\$3.50.**
or with any other wording that may be desired,

ANSWERED

THE INGERSOLL AMERICAN WATCHES

THE Ingersoll watches as shown here have revolutionized the watch trade of the world. They have established new standards of value. Buyers of watches, in justice to their own interests, must consider this line. Foreign buyers have long been accustomed to purchasing cheap watches, both cheap in name and quality, but we now offer an opportunity to purchase watches guaranteed to keep good time at very low prices.

Our watch factory is the largest in the world devoted solely to manufacture of timepieces. The output is five thousand watches per day, which go to all parts of the world.

PRICES
Yankee, \$7.80 doz.
Eclipse, \$10.20 doz.
Triumph, \$13.20 doz.

F. O. B. New York.

Catalogues and full information, also special discount for quantities, may be obtained through your commission house or direct from us.

One gross of watches packed for export weighs about 50 lbs. and measures 1½ cu. ft.

Send all orders through your commission house and send us copy of same.

WHITE SEWING MACHINE COMPANY CLEVELAND, OHIO, U.S.A.

The American Salmon Industry.

THE magnitude and value of the salmon industry of the United States of America are the subjects of an interesting special article prepared for a syndicate of American newspapers by William E. Curtis, a noted journalist and traveler. Mr. Curtis states that 10,000 salmon are considered a good day's catch on the Columbia River, in the State of Washington, the fish weighing from eight to sixty pounds each, but that catches of 20,000 are frequent, and that in the fall of 1903 a single gang of men caught 50,000 salmon in one day. As many as 13,000 salmon have been caught in a single fish-wheel in a day, and all the men in charge had to do was to lie in his bunk and listen to the fish falling into his scow. Mr. Curtis saw 30,000 salmon spread out on the floor of a single cannery one day and 40,000 the next day, the fish ranging from five to fifty pounds in weight. That cannery can handle 150,000 fish a day with two shifts, but the men and women can work only so long because their hands get sore. Salmon packers this year are paid \$1.10 per 1,000 cans, and quick-fingered, experienced hands can put up 4,000 cans a day.

The fish-wheel used in catching salmon on the Columbia River does its business like a grain elevator, or a scoop dredge, and actually pumps the fish out of the water. The fish-wheel is usually placed in the rapids of a river, so that there may be as much power as possible to turn it. A dam is built and a wheel from 5 to 15 feet in width and from 10 to 30 feet in diameter, like an ordinary mill-wheel, is located between abutments. To its blades are attached dip-nets made of galvanized iron netting, and as the wheel is placed in the force of the current it revolves continually night and day, according to the force of the water. Every time it revolves it scoops up from one to a dozen of the salmon that are eagerly crowding each other up against the dam in their efforts to go farther on toward the source of the stream. As the wheel turns it dumps its load automatically into chutes on either side, arranged so that the fish will slide by their own weight into flatboats that are waiting for them. These boats will hold 5,000 or 6,000 full-sized fish, and as fast as they are filled they are towed to the cannery. Night and day, from the beginning of the season to the end, there is a struggling mass of fish below the dam, and the remorseless wheel picks them up by the dozen every time it revolves. A wheel at the cascades of the Columbia River has caught more fish than any other. It has been running since 1879, and has earned millions of dollars. There are between thirty and forty similar wheels on the Columbia, with twenty or more scow-wheels, as they are called, built in a similar manner, but attached to big flatboats that can be moved from place to place according as the fish are running. These wheels throw the fish over into the bottom of the scow, from which they are shoveled out into flatboats.

The scows will hold about twelve thousand sockeye salmon each. During the night, while it is cool, the salmon are pitched into conveyors, which carry them up into the cannery automatically and distribute them about the floor of the "butcher-room," which is kept clean by flooding and scrubbing it every night with salt water. The scows are kept fresh in the same way. During a good season as many as 100,000 fish are received at the cannery every night. Indeed, that many must be received if the plant is kept in full operation. The fish are placed upon long tables, where forty Chinamen cut off the fins, heads and tails, and throw the bodies upon an endless rubber belt, which carries them to the cleaning-machines. These machines are curious arrangements, and each one of them will handle an average of about forty-five fish a minute in a most remarkable way. The entire action is automatic. One man sees that the bodies of the fish enter upon their career in a proper manner. The machine does the rest. The fish starts out belly down, tail first. Automatic clamps clutch the tail and press the body upon a sharp knife which slits open the belly; then a series of scrapers and brushes, with a powerful flow of water, cleans it of all the entrails and blood and dumps it into a tank of running water. After soaking a few moments the fish are inspected and placed in large boxes with slatted bottoms to drip until they are thoroughly drained.

Being dry and clean, the fish are placed in pockets on a revolving drum and carried around to a series of rapidly moving circular knives, which divide them into cuts of just the size required to fill the cans being used. Nine sets of these revolving knives are installed across the cannery, and all are frequently running at the same time, some cutting for tall cans, others for one-pound flats, while still others are cutting for half-pound flat cans.

The cuts are now carried to long tables, where they are neatly packed into the proper-sized cans, which have previously received a small amount of salt. This work is performed by tidy young women. Sometimes as many as 250 are employed during the rush season in July and August. The filling is carefully watched by eight trained inspectors. As the cans are filled they are put in wooden trays, carried to washing vats and placed on a belt which conveys them at the rate of 125 a minute into a machine which covers the top tightly with a disk and then rapidly revolves them into a blast of steam. This thoroughly cleans them from small particles of fish or oil, after which the cans are released on a moving belt, which conveys them to the topping-machine. As they are moving along small tin disks are placed upon the fish, so that later, when the tops of the cans are punctured after the first cooking to allow the steam and gas to escape, the fish will not clog up the hole.

As they approach the topper the open cans are seized and carried around horizontally, and at the same time the tops, which have been carried into the machine from the opposite side, are accurately placed on them at the rate of 125 a minute. From the topping-machine the cans are discharged upon a moving belt that carries them through an iron device which tips them over on their sides, and as they roll in between two steel disks the top is tightly crimped

the body of each can. Next a chain conveyor rolls them first through a pan, where just the edge of the can top is moistened with muriatic acid, then through a solder-machine, kept hot by gas jets below, where the top is soldered securely down.

As the cans leave the solder-machine they are automatically tripped back with the top end down upon a rubber belt, which conveys them along a distance of 14 feet while the solder is cooling. As they pass along this belt they touch the finger of a counting-machine and are registered. A spray of cold water gives the solder a set, and the cans then roll down an iron chute into flat iron crates, or "coolers," as they are called. The small vent holes in the centers of the tops are now rapidly soldered by hand and the coolers immersed in hot water to test for leaky cans. The coolers are next loaded upon low iron cars and run into steam boxes, where they are steamed for thirty-five minutes. The cans are then taken out and punctured with a steel point set in a wooden mallet to let vapor and excess of air escape, after which they are immediately soldered up again.

The coolers are now run into iron retorts and exposed to a steam heat of 200 degrees Fahrenheit for one hour, which thoroughly cooks the salmon and softens the bone. The coolers are then taken out and transferred to warehouses, which usually adjoin the cannery. There the cans are again thoroughly washed, placed on the floor a few hours to cool, and then piled up to await the varnish and labeling. The varnishing is done by a new automatic electric motor-driven machine, which carries the cans through a tank of lacquer, after which they are conveyed along on revolving rollers and fanned with forced air from below, which evenly distributes the lacquer and dries it at the same time. Four such machines are used in one cannery, each of which has a capacity of 50,000 cans per day.

Next the cans are labeled as desired by machinery and placed in the already stenciled cases and nailed down ready for shipment. The cases themselves are nailed together at the rate of 2,500 per day in the box factory upstairs.

Automobiles for Military Use.

DURING the maneuvers of the United States Army in the State of Virginia in September last excellent results were obtained with an automobile of special design constructed for the Army Signal Corps. This vehicle, called the "auto-telegraph car," in general design conforms very closely to a standard high-power, long-distance, touring car, with the exception that, instead of the ordinary tonneau, this machine has a tonneau attachment of special design, more roomy than this apartment in the stereotyped style of machine, and with long seats extending along both sides, the occupants of which face one another.

The functions of this new war automobile are somewhat varied. In the main, however, it is designated as an adjunct for what is now the chief work of the United States Signal Corps—namely, the construction, maintenance and operation of temporary or permanent telephone or telegraph lines. Presumably, its greatest usefulness will be found as a moving base of supplies in the erection of telephone or telegraph lines connecting a military post or other headquarters with a force in the field.

The detachment of Signal Corps men, comprising the auto squad for the new car, comprises eight or nine men. In addition to the operator of the machine, there are one or two telegraph and telephone operators, and the remainder of the squad, while capable of doing service as linemen, are attached to the car principally as an armed guard for the operators above mentioned. The latter are also, of course, fully armed and capable of taking care of themselves in a brush with the enemy. The auto squad is now being perfected in a regular drill as distinctive in character as that of the artillery or any other branch of the army.

Another Great American Bridge.

WHAT is said to be the largest bridge contract ever placed with a single firm was awarded to a Pennsylvania steel concern on October 25th.

It provides for the construction of the Blackwell's Island Bridge across the East River, at New York, which will be longer and heavier than either of the other two bridges now spanning those waters. The bridge will be 10,270 feet long, containing 100,000,000 pounds of steel, 135 feet high, the material aggregating \$5,000,000. It will have eight miles of trolley tracks and four of elevated roads, foot and driveways. It is considered sufficient to carry 150,000,000 passengers in a year. The entire bridge space would admit 1,000,000 persons.

Magnitude of America's Butter Output.

AT a convention of American butter-makers, held in Agricultural Hall at the St. Louis Exposition, October 25th, the chairman of the association, in giving some figures as to the magnitude of the dairy and creamery interests, said that the production of butter this year in the United States would amount to 1,500,000,000 pounds. The value of this output, exclusive of Sundays and holidays, was, he said, \$1,000,000 daily. To move the year's production of butter would require 43,750 cars, each containing 20,000 pounds. This succession of cars would extend 330 miles, if placed end to end, or from the World's Fair grounds to a point forty miles beyond Chicago. If placed in sections of twenty-five cars, 1,750 locomotives would be required to haul the butter output, and it would take 8,750 trainmen to operate the trains. If sections were placed six miles apart the first section would be whistling in Manila, Philippine Islands, before the last section left the World's Fair grounds.

SAWYER TOOL MANUFACTURING CO.,

MAKERS OF FINE MACHINISTS' TOOLS.

Improved Try Square
With hardened blade. Furnished in ENGLISH,
METRIC and ENGLISH and METRIC graduations.

WE SEND THIS WARRANT WITH ALL PRECISION TOOLS.

OUR GUARANTEE.

We warrant this tool to be accurate.

Value of Cement Construction.

AN incidental but highly important lesson taught by the building of the great subway in the city of New York relates to the value of cement construction in masonry. In the original plans for the subway all estimates for masonry work were based almost exclusively on the use of concrete, and the wisdom of that provision is clearly shown in the character and quality of the completed work. George W. Rice, deputy chief engineer of the commission which built the subway, declares that the use of concrete has been beneficial, not only in reducing the cost of the work, but in these times of labor troubles it has allowed the use of unskilled labor in the carrying on of the work, and has, to a large extent, rendered the contractors independent of the bricklayers and other classes of skilled labor. Under competent superintendence the forms can be set and the concrete placed in position with the cheapest kind of labor, and with a certainty of good work if the materials are properly manipulated.

In the construction of some of the tunnels concrete was used exclusively for supporting the surrounding medium, while in other portions of the work, as, for example, the tunnels under the rivers, cast iron and concrete were used in combination. Even the sewers, which, during the course of construction, had to be taken out and rebuilt for varying reasons, were replaced with concrete instead of brick. One noticeable innovation in the use of concrete is its application in the stations where the light is obtained by using concrete reinforced with steel rods and supporting glass cylinders, which light portions of the stations during the day and conversely light up the sidewalk by night by having the light show through from underneath the sidewalks. In fact, the whole of the subway is based on concrete construction, as far as is possible. When it is considered that in the construction of this work, lasting for a term of a little over four years, and that after a very careful inspection no defects in the concrete construction have ever been found, the foresight and correctness of the calculation originally made are manifest, and were evidently based on a proper consideration of the question.

It happened that during the construction of the work a change was made in the plans, whereby the accommodations of a portion of the subway were increased, by making a two-track into a three-track subway at the request of the operating and contracting parties. A small portion of this work had already been constructed along the old lines when the contractor made this request for the change. This necessitated the taking down of a portion of the work, which happened to be a two-track arch span of about twenty-five feet in width. When the work of taking this down was begun the integrity and excellent character of the materials were plainly evident. One very interesting feature in connection with this change was the keeping intact of a portion of the two-track steel concrete subway. This part had been constructed for a short distance when the change was decided upon, and it was found it would be less expensive and more advantageous to cut this two-track subway apart, move the separate portions and build in a portion of the three-track. This was done by severing one side at the top and bottom and moving that part in one direction, while sliding bodily the remaining top and side portion in the opposite direction. This was very ingeniously and successfully accomplished, and shows that a masonry and steel structure which had been constructed properly in the first place, although being mutilated in several parts, can still be utilized.

The amount of concrete which has been constructed under the rapid-transit contracts is very great—in fact, 600,000 cubic yards. It goes without saying that the work has been expedited by the use of concrete and by avoiding the very large amount of brick masonry which otherwise would have been necessary. It is further evident that the work was accomplished at much less cost, and, in all probability, a very much better construction has been secured than would otherwise have been possible, as a better class of work can be obtained with a less amount of supervision. The very fact that the concrete was put in place is sufficient guarantee that the work is well done. In all cases the work has turned out to be of excellent quality, and is sufficiently able to stand any load that may be put upon it. No failure has been noted in any part of the work.

Japanese Studying American Rice Culture.

DR. YOSHISHIGE OTSUKA, Director of the Kiusiu Imperial Agricultural Experiment Station at Kumamoto, Japan, and H. Nukamura, of Tokio, Chief of the Agricultural Section of the Department of Agriculture and Commerce, are making an official study of the methods of rice culture employed in the States of Louisiana and Texas. Their work will include an inquiry as to whether American varieties of rice, as well as American means of cultivating and harvesting the crop, can be profitably introduced into Japan.

—The Smooth-On Manufacturing Company, of Jersey City, N. J., U. S. A., have published a new 100-page catalogue, which they are willing to send free to any one of our readers who will write for the same. This catalogue gives full details of their "Smooth-On" preparations, such as iron cement for repairing blemishes in iron and steel castings, stopping leaks and for making steam and hydraulic connections, also for the prevention and removal of scales in steam boilers. Every mechanical engineer and machinery house should send for one.

Novel Subway in Chicago.

WHILE American interest in the problem of municipal transportation is for the time-being centered in New York's great subway, which is described elsewhere in this issue of THE AMERICAN EXPORTER, a project somewhat similar in character, which is now under way in Chicago, Ill., U. S. A., is bound to enlist earnest attention in business circles. Instead of rushing passengers through subways, leaving the street surfaces to trolley cars and cumbersome trucks and carts, the city of Chicago has built an underground, narrow-gauge railway connected with every downtown business establishment, which will handle the merchandise of the stores, the coal for office buildings, the mail for the post-office, and, it may be, the last editions of the newspapers.

Apart from its purely mechanical aspect, this unique system for intramural transportation, twenty miles of which will be completed by January, and, in the meantime, a portion utilized for delivering coal and carrying away dirt obtained in excavating for new buildings, solves many a municipal problem concerned with conserving alike the commercial and esthetic features of the city. Appealing most to every resident of "dear, dirty Chicago," is its promise to ultimately minimize the smoke nuisance, for it is an astonishing fact that twenty-five railways center in six freight yards within one and one-half square miles in the heart of the business district, the smoke from the engines adding a perpetual per cent. of sootiness to the atmosphere. With the freight handled through the tunnels from outlying freight depots, which the leading railway companies purpose to construct as speedily as possible, the streets will likewise be relieved of the heavily loaded trucks, operated by merchants within this district at an annual cost of \$50,000,000, and moving along in endless procession in the congested thoroughfares at the rate of two or three miles an hour, and of the coal wagon carting the 4,000,000 tons annually consumed in this section. This will leave to the pedestrian better air and more sunlight, render walking on the highway safer, and with the demolishing trucks gone make possible a permanent asphalt street in the business center.

That this freight subway has some Aladdinlike phases may be appreciated by a dive down one of the elevators to the platform 40 feet below the street level. Here one sights the tunnel 6 by 7½ feet underneath the middle of the street, immaculately white with concrete walls and aglow with fifty-two electric lights to the mile. Here awaits a miniature railway train of cog-wheel electric engine and flat cars. The train starts promptly on the subterranean trip underneath the skyscrapers and the Chicago River.

The completed two miles with which the \$60,000,000 corporation has been experimenting satisfactorily for several weeks induced the placing of an order for 150 locomotives and 3,000 steel cars, which, by January, will be able in the twenty miles of the tunnel to carry 50,000 tons of freight daily. The rate of speed will be twenty miles an hour, the trains to be moved according to the block system, the position of every train being shown on a miniature board in a central downtown office and the proper signal for going ahead or stopping given at every corner of the tunnel by the man operating the board. The large firms have readily made contracts for delivering freight, as the tunnel car carries any box passing through the door of the regulation freight car, and for hoisting the merchandise from the tunnel level to their basements they will build elevators of the plunger type. The new buildings going up in this locality, however, are being extended down to the tunnel, providing a sub-basement with tracks like unto a miniature freight yard for the expeditious loading and unloading of cargo while, in the meantime, the dirt obtained in excavating for foundations is removed through the underground passage, thus freeing the streets of the obstructing dirt wagon.

The delivery of packages from retail stores to outlying districts when the company projects the tunnel 100 miles to every section of the metropolis, with capacity of 300,000 tons daily; the speedy carrying of mail, contracts having been made for the daily conveying of 800 tons of downtown mail; the removal of garbage and ashes, and the handling of newspapers and telegrams are numbered among the immediate industrial possibilities of this original intramural freight tunnel.

To facilitate the handling of freight the corporation recently purchased dock property on the Chicago River for \$2,500,000. This land, 400x700 feet, connects with every railroad centering in Chicago. For this so-called terminal and storage plant of the company work is to begin immediately on the largest warehouse ever built for such purposes. The plans include twelve stories, five being below the street level, to provide an adequate underground freight yard for the tunnel.

Practical Test of Fireproof Paint.

AN interesting test of a new form of paint for resisting heat was recently made in the suburbs of New York, U. S. A. Two sheds of light pine were built, and to make the material more inflammable, each building was surrounded with straw. One was painted with what was claimed to be a fireproof compound, and, in addition to the straw scattered around its foundation, contained straw inside. The other shed was not protected. Fire was applied to a heap of straw between the buildings, so that the flames attacked both structures at the same time. Seven minutes after the fire started the unprotected shed was ignited. In twelve minutes its side nearest the fire was ablaze, and in thirty minutes it had collapsed—a mass of ruins. The painted shed was at this time practically unhurt. The straw inside burned, but here also the fireproof paint protected the building, the only effect being to scorch the surface of the boards slightly.

Quality and Price

are the first considerations when making a purchase.

Such is the verdict of thousands of users throughout the "States" of the

WHITE LILY WASHER.
WASHES LILY WHITE.

White Lily Washer.

The White Lily (Rotary) Washer is made from Louisiana and Mississippi Red Cypress, which is less susceptible to expansion and contraction caused by hot or cold water than any other timber known. Our hinges are put on with bolts instead of screws, and every part is reinforced wherever necessary, thus making the

Most Durable Washing Machine Made.

By the use of a HIGH-SPEED ROTARY WASHING MACHINE you can create a soap-suds or foam without having to turn the fly-wheel so fast that the SPEED, rather than the work, tires the operator.

The speed of the White Lily Washer is $2\frac{3}{4}$ turns of the fly-wheel to one turn and return of the dasher. The White Lily Washer is the Highest-Speed Rotary Washing Machine made. Will create more soap-suds with less exertion, and will wash clothes cleaner than any other known washing machine.

Special Offer to Introduce Abroad:

Directors' Tables

No. 63, Grade 1.

No. 63. 60 inches long; 36 inches wide; 52 inches high; weight, 400 pounds.

No. 64. 66 inches long; 36 inches wide; 52 inches high; weight, 430 pounds.

A VERY handsome swell-front desk. Four letter-file drawers with cast brass label-holder pulls, each drawer supplied with index and our special compressing device; 14 cherry pigeon-hole boxes 11 inches deep, with quarter-sawed-oak fronts; pigeon-hole boxes are trimmed with cast brass label-holders and highly polished cast brass knobs; bracket drawers. Large swell-front center drawer.

Pedestal drawers have handsome cast brass ball and socket pulls. No charge for inkwell set.

Special attention given to filling Export Orders. Send for Illustrated Catalogue and Export Price List. Order direct from factory or through buying and shipping agents, and send us duplicate of orders, so as to avoid mistakes.

Electric Railway Signals.

AN important device for using the main-line current on electric railways for operating any system of electrical signaling has been developed by a practical railroad man residing in New York. In using this plan a "shoe" is carried on the car, and makes contact between the main-line conductor and a section of signal rail or wire, forming a divided circuit, a portion of the current passing through the proper signaling apparatus (which may be in the form of a bell, a semaphore arm, or a series of lights) and then grounding. In the system only a section of signal rail is used. In this case the current operates a solenoid, which, as the car enters a block section, throws the signal arm in position in the daytime and lights a series of lamps at night. As this car leaves the block at the other end, current is caused to flow in a similar magnet, which thus throws the arm or the lights to "Clear." In another method of employing the system the right of way is divided into blocks, the signal wire for each block being insulated from the blocks immediately before and after. In this case, however, it is necessary to have a continuous signal line for the whole distance of a block. This causes a signal lamp to burn, or a semaphore arm to show danger, as long as a car is on the block and a current is flowing through the signal apparatus. To increase further the utility of the system, an annunciator in series with the signal-box may be installed in the despatcher's office, the signal wire grounding at the despatcher's office instead of at the signal-box. The system eliminates the use of local batteries, and, as the current is used from the line operating the cars, almost any form of signal apparatus may be installed.

The American Cheese Industry.

WHILE the United States is a liberal importer of European cheese of the costlier varieties, it also exports enormous quantities of cheese of its own production. According to the census of 1900, there were in the United States 3,200 cheese factories, and the total product, including the cheese made on farms, was about 299,000,000 pounds. New York and Wisconsin are the great cheese-producing States, with half a dozen other States following with much smaller production. Much the greater part of the cheese consumed in the United States is of American manufacture, though the imports were considerable. Last year the United States imported 17,067,714 pounds, of which 6,777,435 pounds came from Switzerland, 6,223,435 pounds from Italy, 1,616,169 pounds from France, 1,134,675 pounds from Holland. From Germany the United States imported 391,518 pounds, and from England only 117,003 pounds. The entire importation of foreign cheese was small, compared with the home manufacture and consumption, and the United States exported more than it imported—viz., 27,203,184 pounds, against 17,067,714 pounds.

New Implements of War.

DISCUSSING various new implements of war, a writer in *Everybody's Magazine* says: "The Herreshoffs of yacht-building fame have invented a torpedo and propelling system which, if successful, does away with the torpedo-boat and reduces the submarine in its possibilities. The business of the torpedo-boat is to convey the torpedo within striking distance of the battleship or cruiser and to discharge the torpedo. The Herreshoffs propose to construct a larger torpedo than the present standardized Whitehead, and to use it just as a small whaleback-boat would be employed. Two men wearing life-preservers set out with it from shore, or from large vessels, and navigate it within striking distance of the enemy's craft, point it, lock the steering-gear, slip off into the water and wait to be picked up. The torpedo thus launched with far better aim than from a tube, and with a longer-carrying range, could scarcely fail to sink its victim. As it is now, the percentage of torpedoes that "arrive" is but one in twelve. If a man can cross the North Atlantic in a 16-foot dory, as has been done more than once, two men should be able to navigate a pneumatically sustained Herreshoff torpedo in some very rough weather.

"An invention which, if the weather be in its favor, is of a more deadly nature than any so far considered, is the dirigible torpedo, controlled by wireless electricity from ship or shore. It is merely the ordinary torpedo, loaded with its big charge of gun-cotton and a firing-pin in the head to explode the torpedo when it strikes; fitted with double rudders, one of horizontal blade to steer up or down, one of vertical to steer right or left; a storage battery for ordinary use and propulsion, a wireless current transmitter and motor for dirigible propulsion, and an elevated tube to discharge a small jet of seawater forced through it by an electrical pump. An observer completely sheltered behind earthworks could send out such a torpedo from shore, make it go miles out to sea, wait for a battleship of the enemy, swim around it, dive under it, and with certainty ram its armored bottom with the firing-pin head. One such station could defend the Sandy Hook entrance to New York harbor if the weather were always good."

New Brush for Washing Cars.—A metal brush which fastens to a pipe or hose and throws a controllable stream of water while in use is a recent American contrivance for washing railway cars. Wooden brushes swell and become worthless in a short time. The metal brush lasts much longer. It is a big task to keep hundreds of car-windows bright, and any invention which saves time and labor in the work is always in demand by up-to-date railway companies.

Ingenious Machines at St. Louis.

HERE is a list made at random of half-a-dozen remarkable mechanical appliances which profoundly impressed an intelligent foreign visitor at the St. Louis Exposition and which he kindly pointed out to an American newspaper reporter: In the great power-house of the Exposition 500 tons of coal are fed to the furnaces every day by automatic stokers, and the ashes are cleaned out of the grates and hoisted and dumped on a waste pile in a similar way. One man does the work of forty. Many of these things are familiar to manufacturers and engineers, but they are entirely new and are highly fascinating to the general public, who never tire in watching them. Years ago everything was carried by hand, but now machines do this work easier and quicker.

There is a large variety of "conveyors," as they are called. There are link belts so arranged that packages can be sent anywhere, not only in a straight line, but round curves and at right angles, up and down stairs, and from one building to another. The economy of labor is remarkable. These contrivances can carry packages of any weight or size, from a paper of pins to a freight car loaded with thirty tons of coal or stone. Iron and coal are shoveled out of mines by automatic machinery. There is a dredging shovel on exhibition which picks up a ton of mud at a bite. A 5,000-ton vessel can be loaded or unloaded in twenty-four hours, and ships can be coaled at sea from colliers half a mile away by automatic conveyors which glide back and forth across the water.

There are machines in the Wonder House which perform miracles. If you feed them well with bars or sheets of iron they will give you any kind of a nail or screw or bolt or steel in any form you want. One of the funniest things is a machine that will make a barrel or a cask while nobody is looking. All one has to do is to furnish the staves and the hoops and it does the rest.

There is an automatic coupler for railway trains in operation which looks as if the problem has finally been solved, so that the thousands of lives and limbs that have been sacrificed to the juggernaut every year will now be saved.

There is a miniature piano factory in operation. It is six stories high, built on a scale of one-half inch to a foot, and filled with tiny machinery which illustrates every operation from the time the lumber is unloaded until the piano is ready for the performer. Minute electric lamps light up the interior and show little puppet workmen engaged at their tasks.

How Farmers Fight Frost.

IN many parts of the United States of America, but particularly in the great fruit-growing regions, the farmers use highly ingenious means to prevent the destruction of their crops by frost. In many districts it was formerly a practice to maintain a regular messenger service, that the Weather Bureau's predictions of frost might be promptly carried to farmers and fruit-growers. To-day there are many places where, when frost is predicted, the whistle on a factory in a village sends forth notes of warning over the farming country for miles around. In other localities the news is given by flags placed where they can be seen at considerable distances. More important than these aids to the Weather Bureau, however, are the rural free delivery, the telegraph and the telephone. The telephone in many regions is rapidly supplanting other agencies, and the officials of the telephone companies, whose lines reach to all parts of the country, tell many stories of the way in which the news of the coming of the frost is spread broadcast. In 1903 nearly 30,000 villages and farms received daily forecasts by telephone, and nearly 8,000 had arrangements for receiving special warnings of frost and sudden storm. In that single year the number of places receiving forecasts by telephone increased by nearly 20,000.

While smudge is used for the purpose of creating a cloud of smoke above the surface of the earth and imprisoning the heat which would otherwise be lost by radiation, fires of a different kind are employed to actually raise the temperature in an orchard. Several years ago experiments were tried in California in which oil was used as fuel. It made a hot fire, and was neither expensive nor difficult to manage, but as it covered the trees and fruit with lampblack, the system was not regarded as of great value. Small coal fires, on the other hand, give excellent results, and in the orange groves of California sometimes fifty of them are started in a single acre. This costs about \$4 a night, but as the oranges maturing on the trees in that one patch of ground may be worth \$400, the money spent for the coal fires is really pretty cheap insurance.

Sun Machine at St. Louis.

APYRHILIOPHOR, or sun machine, recently set up in the grounds of the St. Louis Exposition, has generated more than 7,000 degrees of heat (Fahrenheit). Aside from any interesting scientific deductions, which subsequent daily experiments confirmed, the inventor says he has made the following new discoveries: First, the heat of the sun is absolutely of electric origin; second, the intensity of the rays that produce the solar radiation is very much higher than that of the electric arc; third, the sun machine discloses from whence comes the electric energy which holds between the heat of the sun and the stars; fourth, it gives a glimpse of a way to directly transfer the rays of the sun into electric energy.

BORN & CO., Columbus, Ohio, U. S. A.

ONE OF A DOZEN

good reasons why
you should drink

Born's

XX PALE BEER

is because it is
brewed from the
best materials.

A GOOD SPRING TONIC.

ESSEX'S STANDARD STEAM-ENGINE LUBRICATORS.

Essex "Pilot"
Snap Lever, Sight Feed
Glass Oil Cup.

"Simplicity is the Essence
of Durability and Economy."

Such are the ESSEX LUBRICATORS, having few parts (none complicated), made by skilled mechanics, of the best material obtainable; and each lubricator thoroughly tested before leaving our factory.

OUR 1904 CATALOGUE, illustrating and describing the many styles of LUBRICATORS made by us, mailed postpaid to all parts of the world.

We carry a large stock and make Quick Delivery.

Ninety per cent. of automobile makers in the United States of America use exclusively the Essex Automobile Lubricators.

Essex
Glass Body
Oil Pump.

SIGHT-FEED LUBRICATORS, OIL CUPS, OIL PUMPS, OILING DEVICES, GREASE CUPS.

Note.—With the view of facilitating our increasing EXPORT TRADE, we desire to communicate with one energetic merchant in each trade center of the world.

Prices Quoted F. O. B. New York.

Specify ESSEX when ordering. Orders received through export houses. When ordering, to prevent delay and error, please mail us duplicate of order.

Connection
Sight-Feed
Lubricator.

THE G. B. ESSEX BRASS CO., Manufacturer, DETROIT, MICH., U. S. A.

New Form of Pleasure Boat.

AN exceedingly interesting type of pleasure-boat, which may also serve important utilitarian purposes, has recently been devised by an experienced navigator living in the State of Michigan. In this boat there are not only means for accurately surveying the floor of the stream immediately under the boat, but also for making pictures of the same. The latter will open a new field for the amateur photographer, if the scheme proves entirely practicable. The boat is supplied with a glass bottom, and under the bottom of the craft is an electric light which will illuminate the water and the bed of the stream for some distance around. A hooded reflector makes it possible to sit comfortably in the boat and witness the curious things in the water below with great ease, and pictures may be taken also through means of the mirror. The designer has in his possession a number of photographs which were taken by this means, and these are said to be quite satisfactory, although they were made in the early spring, when the water was clouded with dirt washed down into it. These boats will be used during the summer season. Boats somewhat similar to this have long been used in the States of Florida and California.

Boats of the type described should prove exceedingly useful to fishermen on inland rivers and creeks where spearing fish at night with the aid of torches is an old and popular sport. Glass-bottomed craft should also prove of great value in exploring the beds of lakes and streams and in making surveys for the construction of wharves, piers and other public works.

An American Wonderland.

THERE is in the State of Colorado a railroad connecting the tourist center of Colorado Springs with the world's greatest gold camp of the Cripple Creek district, which for grandeur of scenery and marvelous engineering achievement excels anything in this country or Europe. It is the Colorado Springs and Cripple Creek District Railway, better known as "The Short Line," opened for traffic in 1901, since which time its fame as a line of unparalleled scenic attraction and wonderful construction has spread to all parts of the world.

The air-line from Colorado Springs to Cripple Creek is nineteen miles, but this famous railroad, in its ascent of the mountains, twisting and turning around the edges and over the tops of gorgeous cañons, traverses a distance of forty-five miles, and from start to finish presents a continuous panorama of stupendous and bewildering mountain and cañon scenery, which baffles all description. It was a well-known writer, who, after exhausting his entire vocabulary of adjectives before reaching the awe-inspiring Point Sublime, six miles out, declared in desperation that it was "the one-day trip that bankrupts the English language."

Unlike other mountain railroads, The Short Line winds around the rims and over the tops of the cañons, instead of following the stream levels, thus affording a comprehensive view of the indescribable glories of North and South Cheyenne Cañons from the top.

It is universally pronounced the feature of a Western tour, and no traveler to the Pacific Coast would think of passing through Colorado Springs without making the side trip to Cripple Creek over this wonderful railroad, including an inspection of the fascinating gold camp on electric trolley cars. Palace observation cars are run on all trains, which afford the tourist every facility for viewing the incomparable scenery and the best-built railroad in the West.

The time consumed in making the trip is two hours and a half in each direction.

Anglo-Russian War Cloud Dispelled.

AS a result of a serious and inexplicable attack by the Russian fleet on the British North Sea fishing fleet on the night of October 21-22, there was for a few days following imminent danger of war between Great Britain and Russia. Happily, however, the peril was averted by the joint agreement of the two nations to submit the whole affair to an international court of inquiry to be appointed in accordance with a provision adopted by The Hague Conference of 1899. For a clear and impartial view of this unfortunate entanglement the following, from the New York *Sun*, will be highly useful:

"The assurances given by Premier Balfour in the speech made at Southampton on October 28th prove conclusively what should indeed have been self-evident, that responsible statesmen would not permit a war to grow out of the outrage committed in the North Sea on October 21-22 by vessels belonging to Admiral Rojestvensky's fleet. The only danger was that the Grand Ducal cabal which controls the Russian Admiralty might, in ignorance of the pressure exerted by public opinion in free countries, delay so long to promise to investigate and punish an offence against the law of nations that the Balfour Government, in order to allay the rising storm of indignation in Great Britain, might have felt constrained to take some measures for the interception and temporary detention of the Russian warships. In that event a collision might have been unavoidable.

"There never was any foundation for certain theories which for a time found currency in some London newspapers; such as the assumption that the breach of international law, committed when the English fishing-boats were fired upon, was deliberately planned in order to draw England into the war and thus afford the St. Petersburg Government a pretext for saying that, yielding to superior force, it would no longer reject the mediation of a friendly Power. For the provocation needed to drive England into a war, a single torpedo-boat would have sufficed. It would have been superfluous

to sacrifice for the purpose the whole of Russia's remaining sea power. Equally far-fetched is the hypothesis that the violation of neutral rights in the North Sea was prompted by the hope that the neutral Powers would thus be aggravated into taking concerted steps to compel the return of the Russian fleet to the Baltic. No sense of duty or of honor constrained the Russian Admiralty to despatch that fleet to the Far East at a time when it would be scarcely possible to reach Vladivostok before the middle of January. Disinterested naval experts would have approved of the decision to postpone the departure of the warships until next spring.

"All the evidence thus far obtainable indicates that the officers of the Baltic fleet were apprehensive of being attacked by Japanese torpedo-boats more or less disguised. It appears that alarming rumors were current in the Baltic ports, and that the most stringent precautions were taken by the Copenhagen Government for the protection of the Russian vessels while these were in Danish waters. Moreover, the English fishing-craft were not the only victims of the trepidation, not to say panic, produced among the Russian naval officers by the reports to which we have referred. At least one merchant steamer, flying the Swedish flag, had previously been fired upon. Under the circumstances it is conceivable that the officer commanding the detachment which did the firing may have misinterpreted the rockets sent up by the flag vessel of the trawler fleet, or may even have mistaken one or more Russian torpedo-boats for enemies. We repeat that such a blunder, though indefensible, would not be inconceivable, because not unprecedented.

"From the moment, at all events, that a naval commander of high reputation like Admiral Rojestvensky positively asserts, as he does in his official report, that during the night of October 21-22 the Baltic fleet *was* attacked by two torpedo-boats, which, in self-defense, were fired upon, it is obvious that the Russian Government cannot be expected to accept without investigation the British version of the affair. The case evidently is one for impartial inquiry at the hands of arbitrators, and the parties concerned have very properly agreed to submit it to an international commission to be appointed under a provision of The Hague convention.

"All's well that ends well. This deplorable incident, which at one time, in the eyes of thoughtless persons, portended immediate war, seems likely to advance materially the cause of peace by increasing signally the prestige of The Hague Tribunal."

Ostrich Farming in America.

AFTER more than twenty years of harsh experience, involving money losses exceeding \$2,000,000, ostrich-farming in the State of California has at last become a stable and prosperous industry. One ostrich ranch, formerly conducted at an annual loss of \$15,000, is now earning \$20,000 a year, and another returned profits of \$45,000 on last year's operations.

Ostrich-farming is unusually prosperous these days. All the southern California ostrich farms that were losing money steadily a few years ago have doubled and trebled their number of ostriches and increased their land holdings. Some \$700,000 is now invested in ostrich-farming in this region, and the annual output of feathers has grown to be over \$100,000.

The success of California ostrich-farming has come largely from an invention of an ostrich incubator by a young woman in 1894. In ostrich domestic economy the male sits upon the nest of eggs laid in the sand, occasionally relieved by the female. In the hot Nubian deserts this plan works admirably, but on a little farm in the colder climate of California, where the birds flock together, the sitter has so much to detract it from the nest that the eggs are frequently allowed to get cold at night. Therefore, a whole annual setting has often been lost. The incubators have remedied all this, and now the percentage of loss by infertile eggs is less than 10 per cent.

The best ostriches for plumes come from Nubia. The California farms now have a new home-bred ostrich that it is believed will be the finest plume-producer ever known. The first ostriches in America were brought from Cape Town in 1882. There were thirty-four in the flock when they were shipped. Eleven died at sea, and all but six died here a year after they arrived. The pioneer in the California ostrich-farming lost \$30,000 in that investment.

But he started back to Cape Town for another flock. With these he had better luck, but while he was learning how to adapt South African ostrich-farming to California and trying to grow marketable feathers, he lost from \$6,000 to \$8,000 annually for several years. A dozen men were ruined by ostrich-farming in this region in those experimental days, but now all is changed. The ostrich farmers are making large profits.

New Design of Swing Saw.

RECENT American inventions of wood-working machinery include an improved swing saw, which combines the qualities of strength, simplicity and accuracy of work. The frame is cast in one piece, cored and designed to secure the utmost rigidity and exactness and alignment. The adjustable counterbalance may be applied to either side of the frame; when the frame is brought forward this counterbalance carries it back into position after the cut is made. The guard accommodates saws up to 24 inches diameter, and is provided with a handle for pulling the saw forward. The saw arbor is grooved to prevent end motion.

Exports of Sewing Machines.—The exports of American sewing-machines in all ports for the first seven months of 1904 amounted to \$3,357,115, as against \$3,148,297 for the corresponding period of 1903.

Electric Novelties at the World's Fair.

WIRELESS telephones are extensively used among the various buildings and sections of the St. Louis Exposition. They accord a means of secret communication which cannot be interrupted. With the receiver and transmitter of one of these telephones in his possession a person can pass through a crowd, meanwhile sending or receiving messages to or from points within a wide radius without the possibility of interference.

Among the exhibits are electric locomotives which claim a regular speed of more than one hundred miles an hour, and telegraph instruments upon which can be sent from 1,000 to 2,000 words a minute. There are other instruments for sending pictures and handwriting by telegraph, and there are also telephones and phonographs combined, by which one can have recorded on a wax cylinder the messages sent him when he is away. There are electric motors and generators, some of the motors so small they are just fit to run a sewing-machine, and some generators so large that they do the work of 10,000 horses. There are all kinds of storage batteries, some for use in country houses and others adapted to automobiles.

No less interesting are the electric cooking-utensils. A very important thing about cooking and heating by electricity is that it is much more healthy than cooking or heating by coal or gas. Electricity makes less dirt, and the apparatus can be quickly and readily cleaned. Again, you can heat any desired vessel without heating up the rest of your surroundings. You can make coffee without bringing the room to a high temperature, as you must do if you would heat a smaller quantity of water by coal, wood or gas. By the electrical apparatus all the heat is kept inside the coffee-pot and the room at a comfortable temperature. As to the use of electrical heating apparatus in the household, it is safe to say that it is constantly encroaching upon the more primitive methods. Electrical heating and electrical cooking are far superior to any other in the matter of convenience. Wherever water must be heated it can be heated as economically by the electrical apparatus as by gas or coal, and such cooking and heating can be more easily done than by any other means.

One of the most interesting features of the Palace of Electricity is an electrical apparatus by which the deaf are made to hear. Classes of deaf mutes come here and are thus taught to speak, and through this apparatus their education can be carried on. Indeed, it is believed that it will soon be in general use throughout the United States, and that it will do much to better the condition of the so-called deaf and dumb.

American Progress in the Philippines.

NOT least among the results of American influence in the Philippine Islands are those accomplished by medical science for the protection of life and health. The laboratories established by the American authorities are working wonders among the natives.

The demand for vaccine virus has been very great since the American occupation, for until the advent of the Americans no systematic effort had ever been made to vaccinate the people of the islands, and smallpox was always present. A large number of calves were purchased for the purpose of preparing the virus; nearly every one has been properly vaccinated, and smallpox cases are very rare.

A plague prophylactic has also been supplied in sufficient quantities, and its intelligent employment has reduced the plague cases to such a degree that the islands are now practically free from this dread disease.

The struggle waged against rinderpest, which threatened all the draught animals on the islands, was eminently successful, and there is now a herd of seventy-five animals kept for the express purpose of furnishing a serum with which to inoculate non-immune herds.

Oriental coals are deficient in gas-producing qualities; importations from Europe or America would be entirely too expensive for the purpose—gasoline, even, was found to be unsatisfactory.

Nothing daunted, the chemists experimented successfully, and finally adopted the plan of preparing gas from cocoanut oil—a native product. Strong cast-iron retorts are brought to a red heat in furnaces, and the cocoanut oil is then slowly fed into them, thus producing a very high quality of illuminating gas, free from smoke and tar.

These examples will perhaps suffice to show the important work already accomplished through these laboratories. In general, it is interesting to know that provision has been made for housing the branches of chemistry, bacteriology, pathology, botany and entomology, and for preparing prophylactic and curative serums.

It may be mentioned that the biological laboratory is investigating human diseases, and has in preparation a work on a method of protective inoculation against Asiatic cholera and amoebic dysentery. Fifteen bulletins have already been published on medical, veterinary and botanical subjects, some of which have excited wide attention.

Vehicles Capable of Varied Uses.

IN Pittsburg, Pa., U. S. A., there are in use four big Colonial omnibuses for transferring passengers and baggage. Each of the cars accommodate fifteen passengers comfortably, and has two folding side racks, which can be let down for carrying luggage, and a folding rack in front for mail-pouches.

Exports of American Manufactures.

MANUFACTURES formed a larger share and agricultural products a smaller share of the exports of the United States in 1904 than in any earlier year. Figures issued by the Department of Commerce and Labor, through its Bureau of Statistics, covering the foreign commerce for the nine months ending with September, show that 37.87 per cent. of the exports during that period were manufactures and but 52.04 per cent. agricultural products. Comparing these figures with those of earlier years, it may be said that on only two occasions—in the fiscal years 1900 and 1904—have the exports of manufactures formed as much as 30 per cent. of the total exports.

In 1900 they formed 31.65 per cent., and in the fiscal year 1904, 31.52 per cent., but in no other fiscal year have they formed as much as 30 per cent. of the total, and at no time have they for a period of any considerable length formed as large a proportion of the exports as has been the case in the nine months ending with September, 1904. The total value of manufactures exported during the nine months ending with September, 1904, is \$365,000,000, against \$311,000,000, in the corresponding months of 1903, \$338,000,000 in the same months of 1900, \$145,000,000 in the corresponding months of 1895, and \$113,000,000 in the corresponding months of 1890. For the single month of September the exports of manufactures were \$42,690,501, against \$33,244,848 in September of last year.

Agricultural products exported in the nine months of 1904 amounted to \$502,417,678, against \$566,282,378 in the corresponding period of 1903, though in the single month of September the value of agricultural products exported slightly exceeded that of the corresponding month of the preceding year, being in September, 1904, \$78,194,486, against \$64,185,433 in September, 1903. This increase in the value of agricultural products exported in September, 1904, as compared with September, 1903, is principally due to the exceptionally large exports of cotton in September, which were much above the average of September exportations in earlier years.

The share which manufactures form of the exports seems likely in the calendar year 1904 to be greater, and the share which agricultural products form of the total exports seems likely to be smaller, than that of any preceding year. In the nine months ending with September, 1904, manufactures formed 37.87 per cent. of the total exports; in 1903, they formed 33.2 per cent.; in 1900, 33.44 per cent.; in 1895, 20.68 per cent., and in 1890, 20.21 per cent. of the total exports. The above figures relate in all cases to the nine months' periods ending with September. On the other hand, products of agriculture form a much less percentage of the total exports in 1904 than in any earlier year, being in the nine months but 52.04 per cent., while in the nine months ending with September, 1890, they formed 71.84 per cent. of the total exports of domestic products.

Turning to the import side, materials in a crude condition which enter into the various processes of domestic industry amounted in the nine months ending with September to \$248,000,000 and formed 33.03 per cent. of the total imports, as against a total of \$245,000,000, forming 32.37 per cent. of the total in the corresponding period of last year. The steady growth which manufacturers' raw materials are making in the imports of the country is shown by a comparison of the imports of materials of this class in the nine months ending with September, 1904, with those of the nine months ending with September, 1895. In the nine months' period ending with September, 1895, articles in a crude condition for use in the domestic industries showed importations amounting to \$160,591,676 and formed 26.72 per cent. of the total imports, while in the nine months ending with September, 1904, the importations of this class of articles amounted to \$248,155,287 and formed 33.03 per cent. of the total imports.

Windmill Automobile.

PERHAPS the most novel of American traction vehicles is a windmill automobile now in use on the farm of the builder in the State of South Dakota, U. S. A. The frame on which the windmill tower is built is a triangle, the center beam being 2 by 6 and 12 feet long, resting on the guide-wheels at the front and on the axle at the rear. Two 2 by 4's extend from this beam at about half the distance to the outside of the rear. Ten inches in front of the axle is another 2 by 6, extending crosswise and resting on the beam and side bars, thereby forming a triangle that will not rock. Two legs of the tower rest on each beam.

The wheel is an 8-foot steel pumper, remodeled into a geared mill by using some old gear. The windmill is all built of old gear, and it was quite a task to find the right sizes and kinds. At first the vane was used, but as this would not hold the wheel in the wind when it was pulling hard, the gear was attached in such a manner that now the wheel can be regulated with the left hand and the speed also. There are times when both hands are needed, and so a screw is used for a steering device and it will stay where it is set.

This machine runs best against the wind. Of course, it will move sidewise to the wind or with it, but always the best against it. In a good wind it will move about three miles an hour and it could be made to run faster. The machine is 12 feet long, 9 feet wide and 12 feet high, weighing about 800 pounds.

A Valuable Tree.—Included in the exhibit of the State of North Carolina, U. S. A., at the St. Louis Exposition, is a cross section of a famous black walnut log 54 inches in diameter, which, when cut into veneer, produced 8,000 feet of beautifully figured stock.

ordering through export houses specify MILLS NOVELTY CO.'s COIN-OPERATING
MACHINES, and to avoid errors, please mail us duplicate of order.

Deepest Mine in the World.

THE deepest mine in the world is the Calumet and Hecla copper mine on the shores of Lake Superior, U. S. A., beneath which it reaches downward 4,000 feet. If the knife of a Cyclops could cut the honeycomb in two, longitudinally, as Sir John Lubbock used to cut an ant's nest for the purpose of observing what was going on inside, there would be revealed a wealth and a breadth of industry not eclipsed by those of many surface communities. Dozens of elevator shafts, some perpendicular, others on an incline, would be found piercing the comb from top to bottom. In them would be seen cars carrying men and metal up and down with the speed of express trains.

In and out, across and back extend galleries overflowing with activity; in some, lines of air-drills, eating their way into the rock, in others the sudden bursting of blasts in the walls of the lodes. Electric locomotives are hauling trains of rock cars to the shafts, or men are found laboriously pushing hand-cars through darkened subways. Down some of the shafts can be traced pump lines, pipes and cables radiating outward through the galleries, so that the miners may have dry tunnels, electric lights, and even telephone service underground.

In these passages, many of them so deep that the internal heat of the earth can be perceptibly felt, men live and eat and toil and carry on the business of life apparently oblivious of the fact that they are nearer the center of the earth than ever man succeeded in getting before, and are digging themselves nearer every minute. Thousands of men inhabit these towns and villages underground, governed by laws for their peaceful regulation, and provided with efficient systems of fire protection, sanitation, drainage and ventilation.

In the deepest mine there are over two hundred miles of tunnels lighted in part with incandescent lamps and a complete telephone service with a "central" and eighty instruments installed in the galleries, so that the pumpmen on the fifty-seventh level can call up a friend over the long-distance wire to Chicago and tell him how it feels to live in the bowels of the earth.

America's Next Exposition.

THE next great exposition in the United States will be the Lewis and Clark Exposition, to be held in the city of Portland, Ore., beginning June 1, 1905. Compared with St. Louis, the Portland Exposition will be a miniature, but it will equal those of Buffalo, Omaha, Nashville, Atlanta and Charleston. It is to be a million-dollar exposition. Five hundred thousand dollars has been contributed by the State and \$500,000 by citizens of Portland of every class and quality. There are more than three thousand stockholders. Half a million will be spent in buildings, about \$350,000 in the improvements of the grounds and the remainder will be working capital. The Government of the United States has made a very liberal appropriation, and all of the Northwestern and Pacific States are taking an active and generous interest in the enterprise.

The site of the exposition is about two miles from the city—twelve minutes by trolley cars from the center of things. The fence incloses 185 acres of land and 350 acres of water—a lake with an island which furnishes a key of the landscape scheme. Surrounding the lake is a group of low hills, the foothills of the mountain range that embraces Portland, and upon them the buildings will be placed. It is a superb location.

America's Great Horse Market.

THE city of New York contains the greatest horse market in the western hemisphere. Horses worth millions of dollars have been bought and sold privately and by auction in its handsomely appointed show-ring, and its balconies have held many fashionable assemblages on the occasions of the great sales. The Horse Exchange is the property of a corporation, but all sales held there are conducted by one auctioneer, who pays heavily for the privilege. His business is the largest of its kind in the world, nearly every prominent shipper of fashionable carriage and saddle horses in the United States and Canada consigning his stock to the auctioneer when intended for public sale in New York. All the market records have been made at these sales—a four-in-hand for \$10,750, a pair for \$10,200, a single high-stepper for \$7,800, and for a consignment of forty-four trotting-bred carriage horses an average of \$1,494 each.

While the auctioneer conducts all of the auctions held at the Horse Exchange, many other dealers make their headquarters there, disposing of their horses at private sale. From these the manager of the exchange merely collects a certain uniform charge per day for the board of each horse, the payment of the charge for keep carrying with it the right to show and sell in the ring and all other facilities of the exchange.

There is stable room for about five hundred horses at the exchange. During the busy season the usual accommodations for horses are often overtaxed, making it necessary to put up temporary stalls around two sides of the arena.

Worthless Life Preservers.

NEW YORK'S Board of Trade and Transportation has formally condemned life-preservers made of kapoc and tule rushes, and the statement was made that they are so inflammable no steamer should be permitted to carry them. Ground cork for the same purpose was also condemned, and the regulations in force in the United States Navy were recommended

for adoption by all vessels of the merchant marine. A life-preserver full of stuff that will blaze up fiercely while it is strapped on one's body is a "preserver" indeed. Why were we not told of the character of kapoc and tule rushes by the "efficient inspectors?" Who is to be the judge of public safety—a man or men so sodden with either liquor or avarice as to be incompetent, or decent men doing their duty properly? Enough has been had of inspectorial incompetency, and the discovery that the life-preservers already proved inadequate are also highly inflammable is merely one more good and sufficient reason for a thorough "shake-up for the good of the service."

The American Livestock Industry.

THE average reader has only a vague, general notion of the magnitude of the livestock industry of the United States. A brief essay in comparative statistics may broaden his understanding. If shown by official Government count that the horses, mules, cattle, hogs, sheep and goats in the United States number over 220,000,000 head, and that their value is, according to the same authority, over \$3,200,000,000 (see twelfth census of the United States), the figures alone would have very little attraction or meaning to the majority of readers. But when told, in addition thereto, that these animals would make a solid column of more than eighty-nine abreast, reaching from San Francisco to Boston, or if placed in single file a solid procession that would reach nearly ten times around the earth, and further, that their value exceeds the total combined value of all the corn, wheat and other cereals, potatoes, hay, cotton, sugar, molasses, tobacco, lumber, wool, coal, petroleum, silver, gold and precious stones, iron, copper, lead, zinc and other metals produced annually in the whole country, then perhaps some adequate conception may be formed concerning the magnitude and importance of the livestock industry of the United States.

Largest Cut-Glass Vase.

WHAT is believed to be the largest cut-glass vase in the world has recently been completed by a firm in Philadelphia, Pa., U. S. A., and placed on exhibition at the St. Louis Exposition. The vase is 5 feet 7 1/4 inches in height and every inch of it is perfectly worked in sunbursts, chrysanthemums and beaded and notched effects that shed prismatic rays of brilliance and luster. The sunbursts on the star are too large to be designated by that usual cut-glass term, so they have been given a new name, the Louisiana Purchase Star. In all there are 100,000 cuts or deep incisions on the vase, which required turning it 200,000 times. The vase weighs 200 pounds. It was produced by nine men, who spent 2,000 working hours on it. The man who made the blank is 6 feet 7 inches tall. A shorter man could not have handled the great piece of glass. Twenty blanks were turned out before a perfect one was produced. The remarkable brilliancy of the vase is caused by the fusing in the glass of 10 per cent. more lead than is ordinarily used. The vase is several times larger than the previous greatest piece of cut glass, completely dwarfing it.—*Philadelphia Press*.

Splendid American Telescope.—Harvard University, Cambridge, Mass., U. S. A., has recently placed in its observatory the largest operative telescope in the world. This instrument, the gift of an anonymous friend, is described as the "most potent light collector ever yet turned to the skies." The mirror alone weighs more than 2,000 pounds, and the telescope tube itself rises to a height of twenty-seven feet.

Corset Shoes for Children.—What are called corset shoes for children's wear are among the novelties recently introduced by an American manufacturer. Pliable whalebone braces are inserted in grooves on the sides, and may be adjusted to any foot. The purpose of these stays is to preserve a proper angle, thus allowing of a natural, straight and perfect shape. It is said that by use of the corset shoe bow legs, weak ankles and strained muscles and tendons are made impossible.

Natural Woods of Any Color.—The desire to imitate is too strong in the human mind to overcome. As an example, we are now in for a craze at staining various woods for finish, when we can get almost any color we want from natural woods.—*The Wood-Worker*.

America's Longest Pier.—When the last 100-foot crib forming the foundation of the new Government pier at South Chicago, Ill., U. S. A., was put in place in Lake Michigan, a few weeks ago, the outpost was established for what, when completed, will be the longest pier in the world. This pier, from shore to the farthest limit for loading and unloading ships, will be 6,900 feet in length.

Fifth-Wheeled Wagon Gear.—An American inventor has designed a wagon-gearing with two fifth wheels, permitting very short turns of the vehicle and preventing it from being overturned in case of a runaway or accident. One of these is in the usual place on the front axle and the other is on the rear axle, with a tooth-gear connection, so that when the front wheels are turned the rear ones will be inclined in the opposite direction.

Machine for Counting Coin.

AN ingenious application of electricity to labor-saving devices appears in a machine for counting coin, now in use in American establishments in which large amounts of metallic currency are handled. The object of the device is to facilitate the rapid and accurate counting and bundling of coins of all descriptions, from pennies to dollars, since there are many lines of business which necessitate the employment of a large staff of clerks whose sole duty heretofore has been the performance of this laborious task. The machine counts and wraps coins at the rate of seven every second, or 420 coins every minute, and does this continuously as long as the motor runs and coins are fed into the hopper. The coins are wrapped compactly at the rate of from eight to twelve bundles per minute, according to the size of the coins. Since an expert is only enabled to count and wrap fifty coins a minute manually, it will be seen that the machine will do at least as much work as eight men. It is true that each machine requires an operator, whose work consists of a mere cursory examination of the coins. The speed of the machine is limited only by the ability of the operator to detect the spurious coins.

When the machine is in operation the coins are laid upon a table to facilitate examination, when they are dropped into a hopper, whence they slide through a conduit down into the active mechanism, where they are pushed into a row. When the last coin has been forced into its place by a reciprocating push-bar the coins are automatically transferred from a buncher to the wrapper while a new row is being brought into position. As the coins reach the wrapper a roll of paper is fed by three driving rolls placed around the bundle of coins. By a rolling motion the paper is wrapped around the coins twice, when it is cut off by a V-shaped knife. The next and finishing process is turning in the projecting edges of the wrapper, which is done by means of crimpers, drawing the edges in opposite directions, and finally turning out a smoothly rolled package held firmly in place without the use of paste.

Successful Test of an Airship.

HIGHLY successful tests of an airship, designed by Thomas S. Baldwin, of California, were made at the St. Louis Exposition on October 31st.

In charge of a single operator, the airship rose to an altitude of 2,000 feet, where it remained more than an hour against the wind, ascending or descending at the will of the man at the helm, and finally landing within 200 feet of the point from which it started. There was not a moment when the ship was not under the full control of the operator. The mechanical part of the air ship worked perfectly. The gasoline motor did not miss an ignition, and the revolutions of the propeller were steady and powerful.

Photography in Fire Insurance.

IMMEDIATELY after a fire of any serious magnitude in the United States of America nowadays there will be found on the scene expert photographers representing the companies carrying risks on the property destroyed. These men are there for business. Their cameras make uncontested records as to the amount of visible destruction. It is no exaggeration to say that every recent important deduction by insurance engineers in the case of fire-swept places is based upon personal observations made into permanent records by photographs taken on the spot by students of fires. Nothing equals photographic details when close investigations are to be made for insurance purposes, whether before or after a loss.

Not long ago, in a prominent Western city of the United States, public opinion ran high against fire-insurance companies because their rates were alleged to be unjustifiably high. Pictures were taken showing the combustible conditions in the rears of business buildings, alleys, etc. A record was made of inflammable accumulations which no one could dispute; photographs of block after block showed a serious conflagration menace in wooden buildings, wooden awnings, etc. The result was a reform in local safeguards against fire which enabled insurance companies and property-owners to do business on a mutually satisfactory basis.

Casualty insurance companies which issue employers' liability policies are relatively almost as great users of cameras as the fire-insurance people. Unsafe conditions of factories, mills and workshops, by which the lives or limbs of workmen are jeopardized, are duly recorded in photographs. Probably no other single instrument brings about so many reforms and corrections, in the interest of public safety, as the underwriters' camera. The photographs of dangerous defects lead to early corrections in the majority of cases. But it is in fire insurance that the camera is in greatest demand. There it turns out with the fire-engines and remains in service after the fire-extinguishing apparatus and the fire-insurance patrol have gone home.

Windmills for Electric Power.—Using the wind to generate electricity for farm use is no longer a novelty. The first of these windmills were used experimentally to generate electricity for lighting houses and barns. Success has since stimulated attempts to use them for more ambitious projects. To-day a good many are being run to generate power to operate small motors. The windmills are strongly built, and are designed to take the wind at any angle. The regulation of the motor is effected by an automobile switch, which cuts out the battery when the wind falls to a low pressure.

Salt Lakes to Be Utilized.

THERE are several extensive salt lakes in the State of Texas, U. S. A., which have long been regarded as worthless, but which it is now proposed to utilize for commercial purposes. Stock-growers have been using salt from the shores of these lakes for many years, but no effort has been made to refine it. Cattle eat it freely and it has no injurious effects. It is now proposed to purify this salt according to the usual methods and put it on the market. To collect the salt shallow tanks will be constructed, and when the water evaporates the salt can be obtained without being mixed with foreign ingredients.

Opening a New Industry.

THE United States Fish Commission has recently made some valuable tests looking to the utilization of the skins of water animals for clothing. They have already proved that several kinds of fishskins make excellent leather for some purposes. Salmon hide is found not only serviceable for boots, but among the Eskimos it has been used for generations in making waterproof clothes. The people of the Far North also use codfish-skins for jackets. The skins which the Fish Commission people have found practicable and durable are whaleskins and seal leather, which dye in beautiful colors.

Woolless Sheep.

THE United States Department of Agriculture has recently imported five woolless sheep—four ewes and a buck—for use in the extreme Southern States. A heavy crop of wool is a burden in hot, dry districts, resulting in a direct ill-effect on the quality of the mutton. These sheep are being experimented with by the Bureau of Animal Industry. They are hardy and are easy keepers. They were brought from the Barbadoes, where they proved profitable.

Commercial Travelers Using Automobiles.

LARGE numbers of commercial travelers in the United States of America are now using automobiles instead of making their trips on the railway. Some traveling men have tried the new method this summer and have been successful in doing more business, in covering more territory and in cutting down former expenses. It is claimed that one man while traveling in his car met eight farmers on the roads within a month, all having had a breakdown of their horse-drawn rigs. The drummer took them home in his car, and, as a result, sold new buggies and other goods.

A New Type of Pump which is sure to be exceedingly useful for certain purposes has been devised by a resident of the State of Virginia, U. S. A. This device, designed primarily for country houses and for small towns having no water-works, has for its principal object to provide an improved form of pumping, whereby a supply of water may be held under pressure in a pump-barrel within the well and gradually discharged through a valved pipe leading to a house or other point where the water is to be utilized.

Interesting Horseshoe Nails.—An American firm has assembled a particularly attractive collection of horseshoe nails. They include corrugated nails, requiring no clinching, nails for city use, lighter nails for soft country roads and still more delicate nails for track use. All are made of the same metal, which is so tough that a nail rolled out to a ribbon the thickness of heavy paper and three feet long shows no sign of weakness, and may be coiled to fit in a pill-box, while on being released it springs out to its original straightness.

Traveling Lighting Plant.—A locomotive engineer employed on an American railroad has devised a novel isolated traveling lighting plant, which consists of a small box-car equipped with a gasoline motor, operating a 300-light dynamo. This car will be attached to the rear end of the train and the light wires connected, thus furnishing the illumination for every car. With this arrangement the motor would be kept running at all times at constant speed, without reference to the operation of the trains and the necessity for storage batteries would be eliminated.

Tugboats in the United States.—It is stated on the authority of the *Nautical Gazette*, a technical journal of the highest character, that \$800,000,000 is invested in tugboats in the United States of America. There are by actual count no less than 521 tugboats attached to the port of New York, which does not include the dozens belonging to other ports which are seen in the harbor every day.

States Rich in Lumber.—As illustrating the extent and value of the forests of the United States of America, it is pointed out that according to expert estimates there are in the single State of Oregon 235,000,000,000 feet of timber, which, if cut into lumber and sold at the minimum price of to-day, would bring \$4,020,000,000, or almost twice as much as the entire amount of money—gold, silver and paper—in circulation in the United States. An equal amount is standing in the State of Washington and about half as much in California. And it is the finest timber and lumber in the world for ordinary purposes—for house building, for bridges, for railway cars and other necessary purposes.

TARR & WONSON'S COPPER PAINT

For Wooden Vessels' Bottoms, prevents boring of worms and all marine growth.

Awarded Eight Highest Medals:

Gold, Silver and Bronze.

Excels on Every Point.

Cheapest to Use in the End.

TESTIMONIAL. NEW YORK, Aug. 3, 1903.

Messrs. Tarr & Wonson, Ltd., Gloucester, Mass.

Gentlemen: It affords me great pleasure to comment to the credit of your copper paint.

I used your paint on my vessel here December 10, 1902; bottom in poor condition for good coat-damp; remained at the dock here forty-nine days; thence to New London, Conn.; thence to Cay Frances, Cuba, where we remained at anchor in only 18 feet water—water very warm—for eighty-seven days; thence back to New York, when I hauled on dock for painting again, July 5, 1903. I found the surface clean and clear of sea growth of every nature, hence my relative feelings toward your product is, beyond doubt, to the head of the list to stand the severe test as it did of the shoal, warm, clear Cuban water, and I claim its outfit is complete. Yours very truly,

(Signed) A. A. LOWELL, Master Sch. Edward H. Blake.

THE WORLD'S STANDARD FOR FORTY ONE YEARS

RACING COMPOUND for Wooden Yachts' Bottoms, Bright and Smooth.

Manufactured Only by TARR & WONSON, Limited, GLOUCESTER, MASS., U. S. A.

The Handy Fruit and Vegetable Slicer

The most interesting kitchen utensil ever invented. It slices every kind of fruit or vegetable into an infinite variety of unique and fancy designs, making an entirely new, novel and delicious product.

Is invaluable for making delicate salads, garnishings, etc. Makes Juliennes ten times as fast as by the ordinary method and is the only utensil that will produce Lattice Potatoes. Is extremely simple to operate and sells rapidly wherever shown.

\$16⁵⁰/₁₀₀ Upon receipt of SIXTEEN and 50-100 DOLLARS in U. S. Gold or its equivalent, we will deliver boxed, ready for steamer, F. O. B. cars New York, one gross [144] No. 6 X SLICERS, for Export only. Weight boxed, 120 lbs.

NOTE.—To facilitate our rapidly increasing export trade we desire to arrange with one responsible business house in each trade center of the world, to handle our NO. 6 X SLICERS and other specialties manufactured by us.

Make Large Profits Easy by Economizing in Time, Labor and Money.

We make a strong, practical and automatic machine for every stage of Potato Culture; in fact, the Aspinwall is the only complete potato implement line in the world.

With Our Machines seed is quickly cut to best advantage. Planting, fertilizing and covering are accomplished at any depth and width of row desired. Spraying is effectively done for bugs and blight. Digging and sorting are made pleasant and agreeable work by our time and labor saving machines.

Our catalogue, illustrating and describing the various styles of

ASPINWALL POTATO

Planters, Cutters, Sprayers, Diggers and Sorters made by us, mailed postpaid.

Aspinwall Mfg. Co., Jackson, Mich., U. S. A.

"IDEAL" Steam Cookers

FREE Book of 36 pages, printed in colors; handsomely illustrated; tells all there is to know about steam cookers—round or square. The 1904 models of "Ideal" Steam Cookers are entirely new in principle, design and special features. The only steam cookers made in which both round and square have whistles to call the cook when water is needed. Seamless copper tank bottoms.

Cooks a whole meal over one burner, on gasoline, oil, gas or common cook stove. Reduces fuel bills one-half. Agents wanted.

We Want Foreign Agents, and to get them quickly, we are making the following liberal proposition for this month:

No. 20, Sq., Copper Tank
Retail \$6.50 Each.
18-gallon food capacity. 12 Cookers in a box. Measurements and weights of boxes holding 12:

Gross weight, 210 lbs.
Net weight, 144 lbs.
Cubic feet in 12—28.
\$39 doz., f. o. b. N. Y.

No. 6 Round Cooker
Retail \$5.00

10-gallon capacity. 12 Cookers in a box, nested, solid. Measurements and weights, 12 in a box:

Gross weight, 150 lbs.
Net weight, 120 lbs.
Cubic feet in 12—11 1/2.
\$33 doz., f. o. b. N. Y.

These are our best sellers, but we make thirty different sizes of Cookers. Boxed ready for steamer. Order direct or through export house; in latter case, mail duplicate order to us to avoid errors.

We manufacture a full line of Kitchen Specialties and Blue-Flame Wickless Oil Stoves.

TOLEDO COOKER CO., 2301 Albion St., Toledo, O., U. S. A.

F. R. PATCH MFG. CO.,

RUTLAND, VERMONT, U. S. A.

BUILDERS OF

Stone-Working Machinery.

Specialists in the Construction of Planing, Sawing and Polishing Machines for Stone.

The world-famed marble mills at Rutland, Vt., owned by the Vermont Marble Co., are equipped with many of these machines which give the smoothest and best polished surface obtainable. This "Marble City" Polisher will polish any stone up to 3 feet in thickness. It has a swing of 7 feet 8 inches, so that by turning stone around, 15 feet or more square can be polished.

A patent wind-up apparatus either raises or lowers the polishing arm, as is desired, by merely pushing in or pulling out the lever shown near the handle in the cut. This rising and lowering apparatus consists of small gears on a level shown at the top of the machine, which itself rises and falls on the screw shafting, easily seen in the cut.

The total height of the polisher is 9 feet 6 inches and weighs, when boxed ready for shipment, 1,600 lbs.

We carry a large number of these in stock, so that prompt delivery can be made.

NEW JERSEY PAINT WORKS,

HARRY LOUDERBOUGH, Proprietor,

JERSEY CITY, N. J.

U. S. A.

Remarkable Fact.

This cut is a copy of a photograph of a board having one end painted with New Jersey Copper Paint, manufactured by Harry Louderbough, proprietor of New Jersey Paint Works, Jersey City, N. J., U. S. A., and placed in the water at Port Royal, S. C., for five months. Upon the unpainted end you can note the ravages of the salt-water worm so destructive to wood, and also the large number of barnacles that have fastened upon it. Observe the painted end, where New Jersey Copper Paint was applied—its splendid condition.

A PAINT THAT PROTECTS.

The board here represented was placed in the water at Port Royal, S. C., by me, and left in the water five months. The painted end was as good as when it was placed in the water.

The Tucker Alarm Cash Till.

A perfect day safe. The act of closing locks the till. Over one million now in constant use. No key to be lost. Susceptible of 32 changes. Opens like a common drawer. A terror to sneak thieves. Handsomely finished in walnut, oak or cherry woods. Varnished and polished.

As a piece of cabinet work, well worth its cost.

Sounds the alarm promptly if tampered with. Delivered (1/2 doz. in a case) free to vessel. Catalogues in English and Spanish.

"FOR THOSE WHO WANT THE BEST."

Fiberlite Shade and Holder.

Shade made from fiber similar to that used for lining sockets. Mottled green on outside and pearl gray inside. Fiber finished under pressure which gives it a gloss finish, furnishing fine reflection for light. So tough that edges will not break and so springy that it cannot crush. Holder of heavy wire; one piece, clamps to socket with a catch. One catch and no screws. Fastens to inside of shade and any tendency to pull off only makes it hold more securely.

Light as aluminum shades, which means cheap freight rates.

TO INTRODUCE ABROAD:

Upon receipt of \$40.00 in U. S. gold or its equivalent, we will box and deliver f. o. b. cars at New York, five gross of these shades in assorted sizes.

NASHUA TILL CO. NASHUA, N. H. U. S. A.

ESTABLISHED 1859

The drawer is made with Oak or Black Walnut Front, varnished and polished.

The sides, back and half-globe sliding coin cup of hard wood, finished in oil. The apartments made to accommodate the currency and coin of the country in which they are to be used. Size, 17x18 inches.

The Lock has 32 Combinations,

which can be changed instantly, and CAN NOT be discovered by the feeling of the finger keys. This lock is safe, convenient and perfect. The Alarm does not sound except when an attempt is made to open the drawer by an unauthorized person. This drawer is the original automatic alarm cash till of America and is now in universal use by merchants in U. S. A.

Style No. 2.

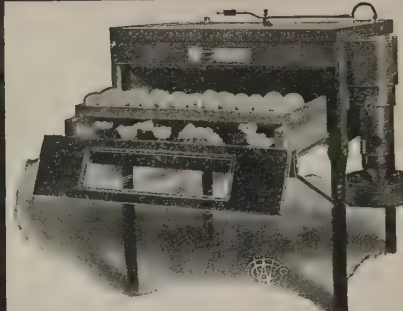

The VAN BIBBER-ROLLER CO.

CINCINNATI,
OHIO, U.S.A.

VAN BIBBER'S "ROUGH AND READY" ("El Tosco y Listo").

PRINTERS' ROLLERS

For ANY climate, hot or cold, can be made at once by any printer. You can make the best rollers, as hard or as soft as you please. No roller can be better. "Rough and Ready" does not spoil from age. English and Spanish directions. Price, 35c. List per pound, 77c. List per kilo, f. o. b. New York. Being an unfinished composition, the rollers when made cost less than this. Send to us for pamphlet. Used since 1878. We are manufacturers who sell at first hand and invite correspondence from prominent foreign dealers, to whom we offer special inducements; or, if you prefer, order through Amsinck & Co., American Trading Co. or any other responsible New York exporter.

Printers' Roller Composition.

Gem Incubators

Are low in price, but this does not mean that they are cheaply made, or that they are inferior in any way. In fact, they are high grade in every particular and have several important features not to be found in any other hatcher.

Prices reasonable. Results guaranteed. Send for beautiful illustrated catalogue, mentioning this paper. Reliable agents wanted. Address

GEM INCUBATOR CO.,
Box A1, Dayton, Ohio, U. S. A.

A HATCHING WONDER

The new **CYCLE HATCHER**. An entirely novel method of hatching and brooding chicks. Requires only the self-supplied moisture of the egg itself. No egg-tray doors to open. Regulation automatic and exact. Holds from 50 to 10,000 and can be set with 50 or more eggs per day, making it unnecessary to fill entire machine at starting. Eggs cooled without removal from machine. Will hatch hens, ducks, geese and turkey eggs equally well at the same time. Made entirely of metal and asbestos. Is fire-proof and will not warp, swell, shrink or crack. 50-egg size, 7 x 17 1/4 inches; weight, 12 lbs. Net price, \$5.00. For full particulars address

**CYCLE HATCHER CO., Salem, N. Y., U. S. A.**

"They Sound Different" For Violin, Guitar, Mandolin, Banjo, Harps, Etc.

Carefully and accurately made from tested materials of superior quality. The product of the most modern type of American machinery and skilled labor. Specially packed with reference to climatic changes and thus kept free from rust and tarnish indefinitely. For Tone Qualities, Strength and Beauty of Finish they are unequalled. Samples and Prices on application.

Don't Buy Without Reading Our

Incubator Book.

First of all, get this book. No matter what other makers you write for a catalogue, write us, too. We will send you the best book of all—written by the man who has devoted 22 years in perfecting RACINE HOT-WATER INCUBATORS AND BROODERS. When you learn what he knows you will want his machine, we think. The book is our illustrated catalogue—that is why we send it free. But it is more than a catalogue. It tells all that an incubator should be and why. Write to-day for it. Reliable representatives wanted. Prices quoted for export admit of big profits. Address

Racine Hatcher Co., Box 217, Racine, Wis., U. S. A.**Incubators**

THE BEST THAT SCIENCE
AND MONEY CAN PRODUCE.

"SUCCESSFUL"

is regarded by those who have made money out of poultry raising as the greatest egg-hatching machine of the day. Heat, moisture and ventilation controlled automatically. Hatches well in the hottest and driest climates of the world. The walls of our machines are built on the refrigerator plan and packed with mineral wool asbestos. Sizes from 54 to 400 eggs. Prices from \$10 to \$37. Both hot-air and hot-water heating systems used. All hot water tanks made of 14-oz. planished copper.

A reliable representative wanted in every foreign country who is prepared to purchase a supply of incubators and brooders. Catalogues printed in English, French, German, Swedish and Spanish. Send for either Catalogue. Address

DES MOINES INCUBATOR CO., Dept. 611, Des Moines, Iowa, or Dept. 611, Buffalo, N. Y., U. S. A.**200-Egg Incubator for \$12.80**

The simplicity of the Stahl Incubators created a demand that forced the production to such great proportions it is now possible to offer a first-class 200-egg incubator for \$12.80. This new incubator is an enlargement of the famous

WOODEN HEN

recognized the most perfect small hatcher. This new incubator is thoroughly well made; is a marvel of simplicity, and so perfect in its working that it hatches every fertile egg. Write for anything you want to know about incubators. Send for the new free illustrated catalogue.

This Trademark on every package.

And we are the only Makers.

Have you seen Albany Grease? How many know its worth?

Cost of using Oil.**Cost of using Albany Grease.**

Look out for Yellow Label.

Cable address: "OEZRIC," New York.

ADAM COOK'S SONS.**313 West Street, New York, U. S. A.****OUT-HATCHES ITS COMPETITORS!**

Why does the Reliable Incubator give such remarkable results—hatching 85, 90, 95 per cent. of the fertile eggs? Because our heating, regulating and ventilating systems give pure, vitalizing oxygen to germ and growing chicks. Other reasons why the Reliable is a profit-bringer are its durability, and economy of time and material. It has double top and bottom, made of best kiln-dried lumber, so treated as not to absorb moisture.

Reliable Incubators

have trays so constructed that it's easy to reach either eggs or chicks. Remember, too, that the Reliable out-hatches its competitors so often because the heat in corner or center

is always the same temperature—a mellow, even heat in every cubic inch of the egg chamber. Our new catalogue is free. It tells a lively story giving warnings, and simple, yet full instructions on hatching and raising poultry successfully. Just send 10 cents to pay postage

RELIABLE INCUBATOR & BROODER CO., Box A 000, Quincy, Ills., U. S. A.**WILLIAM F. MARTIN,**

WORCESTER, MASS., U. S. A.

TO ADVERTISERS.

THE AMERICAN EXPORTER is the only *independent* and *impartial export paper published*. It is *independent* because its publishers are not engaged in any other branch of the export business. They are neither export commission merchants nor manufacturers' selling agents, and hence they are under no more obligations to one advertiser than to another.

It is *impartial* because it treats all its patrons alike. It cannot, for this reason, and it does not, publish write-ups or puffs of any specific make of goods, no matter whether advertised in it or not. It charges the same price for the same services to all alike.

We desire it distinctly understood by those who contemplate advertising in THE AMERICAN EXPORTER that space for advertising purposes is sold only upon the merits of the publication for that purpose. For this reason no advertising solicitor or agency has any right or authority to agree to give reading notices or to perform any special service whatever to obtain orders for advertising.

We make it a practice not to discuss the merits or demerits of other export trade papers. Comments on their value may be made with more propriety by those advertisers who have had experience in the use of such publications.

75% OF YOUR PAINT BILLS SAVED BY THE USE OF OUR PAINTING MACHINES AND READY=MIXED COLD=WATER PAINTS

Read the following from one of the largest painting contracting firms in the United States:

St. Louis, Mo., January 30, 1904.

THE HOOK-HARDIE COMPANY, Hudson, Mich.:

Gentlemen—In reply to your letter of the 25th inst., our contracts on the buildings of the LOUISIANA PURCHASE EXPOSITION amount to something over 12,000,000 SQUARE FEET, all of which is practically completed at this writing, and at least 95 PER CENT. OF THIS WORK WAS DONE WITH THE MACHINES WE BOUGHT FROM YOU. We examined all of the machines on the market and tested quite a few, finally deciding on your machine and one made by another firm. Shortly after starting work we dropped the other machine entirely on account of the large amount of time lost by the machine getting out of order. We also ran two lines of hose from your machine without increasing the number of men on the pump, something we could not do with any of the other machines, thus increasing the efficiency of both machine and men employed 100 per cent.

WE TAKE PLEASURE IN STATING THAT, IN OUR ESTIMATION, YOUR MACHINE IS FAR SUPERIOR TO ANYTHING ON THE MARKET.

THE COLD-WATER PAINT USED AMOUNTED TO ALMOST 400,000 POUNDS.

Respectfully yours,
BUILDERS' CONTRACTING COMPANY.

No. 3 "Rapid" Painting Machine.

Our Ready=Mixed Paints

are made from pure minerals, ground with a liquid chemical into a thick paste, which only requires the addition of water to be ready for instant use.

Our Ready-Mixed Paints are

**WASHABLE,
WEATHER-PROOF,
FIRE-PROOF,
SANITARY**

and Cost but One-Tenth (1-10) as Much as Oil Paint.

Made in WHITE and a variety of colors.

Packed in strong, iron-hooped barrels, half-barrels and kegs.

Our booklet, entitled "Your Painting Bills Made Smaller," contains valuable information concerning Paint and Painting Machines, a copy of which will be mailed postpaid to any part of the world.
